I'm just tidying up a homegrown word processor that supports 80 columns (via the XEP80) and FULL XE MEMORY SEAMLESSLY. Eventually I'll throw in mouse support and a lot of other stuff to make it the first really decent word processor for the XE/XL (sorry, but Textpro sucks). Anyway, I've got partial source for a sotware 80 column screen driver, but I'm looking for complete source or object code. I'd like to include a software driver when I release this as shareware, and I'd prefer not to have to write it all myself.

So, if you can direct me to the source for such a beast, I'd appreciate it.

Thanks,

-Roy Wood (rrwood@contact.ca)

3519. Old COMPUTE! Article

Newsgroup: comp.sys.atari.8bit
Date: 1990-12-18 16:54:58 UTC
From: dstrombe@ucqais.uc.edu
Message-ID: <2578@ucqais.uc.edu>
Source record: 114473

I've a favor to ask.

Back in 1984, two of my submissions to COMPUTE! were accepted for publication. I got the reference for one (which appeared in the regular magazine), but never did get the reference for the other (which apparently came out on something called "COMPUTE!'s Disk").

Now it's resume time, and I'd like to say something more than "Publication data unavailable" for that other article.

Does anyone have that reference? Did anyone even *see* it? It was called "Undelete for Atari", and ran on (early?) 8 bit machines. It simply read a deleted file from disk (with the standard FMS) into memory, waited for you to swap disks, and wrote that file onto the new one, properly allocated. (I *know*, no good for big files, but...)

BTW, the article I *did* see, which was accepted at the same time, appeared January of 1986, so that might be near the time I'd expect to see this other.

Many thanks, to anyone who can provide even a little help on this.

- Dan Stromberg

3521. Interfacing Atari joysticks to macs

Newsgroup: comp.sys.atari.8bit
Date: 1990-12-19 05:28:59 UTC
From: rcnelson@icaen.uiowa.edu
Message-ID: <3655@ns-mx.uiowa.edu>
Source record: 114475
Cross-posted to: comp.sys.atari.8bit,comp.sys.mac.hardware

Hi, netfolk...

Just wondering if anyone has ever seen instructions telling how to make a
Macintosh look at an Atari-type joystick.

I've noticed that most mac programs assume we don't have a joystick, and
that we hate the mouse for gaming. (point, yes....shoot aliens, no way.)
Thus, they use the keyboard. But never more then a few keys. I'd like
to do any or all of the following:

o Use my atari-type joystick thru any of the mac ports to emulate a mouse
This also includes the atari-trakball I got for ten bucks.

o realising that's asking a lot, I'd like to use my mac to look at the
joystick, findout which of the nine buttons are being pushed and then
using software, convert this to a keypress. Anyone know how to write
a cdev for this kind of thing?

o Finally, before I got the mac, I hardware hacked the hell out of my
trusty Atari 800. I REALLY miss the ability to look at a resistor
(disguised as a 'paddle') as easily as it was on that machine.
How can I hook up paddles to my mac? I want a $3000 etch-a-sketch! :)

If anyone tells me anything interesting, I'll post it to the net.
Better yet.....post it yourself! I'm not greedy. I can read off the wall.

Thanks for any help you've got.

Source record: 114476

Uuencoded on the Unix; type uudecode <source> dest and download. Rename resultant .OBJ file as AUTORUN.SYS on your Atari disk. This program speeds up output to your screen by about 300%. To disable, use POKE 846,0. To disable the "HIT ANY KEY TO CONTINUE" prompt which is displayed at the end of each page of screen output, POKE 847,0. To enable either of these features, POKE the respective location with 1; the program defaults to turning both on. Some notes: POSITION x,y no longer works after loading this routine. Although it puts the cursor on the proper y location, the x coordinate is always zero. Also it will not improve speed with some programs -- most notably, those that write to screen memory directly, such as Action! and many popular word processors. It will work with Basic. There is no need to load it before Bobterm because Bobterm already has a screen accelerator. Finally, since the program resides on page 6 it is not compatible with many other programs.

From: BPorter@world.std.com
Message-ID: <1990Dec20.004101.23780@world.std.com>
Source record: 114477
Cross-posted to: comp.sys.amiga,comp.sys.apple2,comp.sys.atari.8bit

This is the second call for discussion on creating a newsgroup for the Boston computer Society. The name of the group was tentitively to be comp.org.bcs, but the name is up in the air so the group will not be confused with the British Computer Society. The group will be unmoderated, and will serve as a focal point for the BCS to communicate with computer users world wide. The BCS has interest groups for most PCs (both current and orphan) and many other special interest groups covering topics like ham radio to database to email.
It would be
a place for meeting notices, meeting transcripts, minutes of important committee meetings and on line newsletters to be sent and shared with all interested. In February, if the group gets created, we will possibly be able to take on line membership info....There are many other interesting things, like live meetings on line that can be done on internet and discussed in this group. If you are interested and would like to support this effort, please post your comments to news.groups with a copy to BPorter @ world.std.com thanks!

There are a few vt100 emulators out there. The best one I have come
across is Kermit65 by John R. Dunning. It is public domain and is availabl
at Atari.Archive.Umich.Edu. If you don't know how to access the Atari Archive
post a message or email and I'll tell you to do it.

Out of curiosity, what type of system do you want to call into (unix,vax)
and what kind of modem are you using.

3528. Atari Archive Help File

Newsgroup: comp.sys.atari.8bit
Date: 1990-12-26 16:56:18 UTC
From: nin15b0b@merrimack.edu
Message-ID: <20887.2778d632@merrimack.edu>
Source record: 114483

The Terminator Atari Archive Help File

Welcome to BART, Brode's Archive Retrieval Thang, Terminator's Atari mail server. To use the server, send a message to atari@atari.archive.umich.edu. The subject line is ignored. The body of the message should contain, one per line, any of the following commands. Each of the commands sends its output back to you via mail.

"help"
This command tells BART to send you this file.

"index"
This command tells BART to send you the Index. Currently, the index is a listing of all the files int the Atari area. Descriptions of various files can sometimes be found in the Index file of each directory. These must be requested individually with the send command. They are currently incomplete, but it's all we have for now.

"path mail-address"
This command tells BART where to send the requested files. This is useful for specifying a mail path.

"send directory/filename"
This is the command that sends out files from the archive. The server only lets you get files from the ~atari hierarchy so you only have to specify the subdirectories in the atari tree. You can determine the path and filename from the Index file. For example, if you wanted to get arc, you'd send a message with a line in the body that looked like
send archivers/arc.ttp
to get the index file, use
send Index
Binary programs are uuencoded before they are sent out. If you miss parts of a file, rather than re-request the whole thing, you can give BART a comma separated list of the parts you are missing and it will send you those parts. For example...
send languages/gcc.arc aa,ac,af
This is the only way to get files larger than 400K. You must request the file by parts until you have the whole thing.
Note: BART does not accept wildcards such as ? or *.

"sendb directory/filename"
This is similar to the send command except that it
always uuencodes the files that it sends out. Send
tries to determine whether it is sending a binary
or ascii file and only sends uuencoded messages when
necessary.

While the commands are not case sensitive, the filenames are, so be
careful you are using the correct case before complaining that the server
is broken.

You are limited to 400k and/or 5 files per day. It takes 24 hours from
the time that bart received your last message to clear your quota
records. BART does not queue requests that went over quota and send them
out later. You have to re-request them 24 hours later.

BART tends to ignore your mistakes. You will not receive a message back
if you gave an illegimate command or specified a bad file name. This was
a deliberate design decision. It may not be user friendly, but it keeps
the mail queues short and prevents a couple other nasty things.

Submissions are always welcome. Please mail them to
weiner@atari.archive.umich.edu

Message-ID: <37328@cup.portal.com>
Source record: 114486

Don't know for absolute certain on the "1050 power supply," per se, but if it is like all preceding Atari power supplies there is a fuse inside the "black box" that is USUALLY the cause of death. This can be fixed yourself IF you can crack (literally) the case open; Atari made no provision for field replacement of this fuse, so the only way to get the case open is to literally squeeze it til it pops. A large workbench-type vise or clamp should be just about perfect for the job; my Dad for instance has one of those big wooden carpenters' clamps, and you just pop the power supply in there and screw down til it gives.

One thing you should do before and in addition to replacing that fuse (if it does in fact turn out to be the problem) is finding out why it blew and correcting the overall problem. Otherwise it's just going to blow again.

Chris

3533. Two Questions

Newsgroup: comp.sys.atari.8bit
Date: 1990-12-28 22:00:21 UTC
From: Chris_F_Chiesa@cup.portal.com
Message-ID: <37329@cup.portal.com>
Source record: 114487

1) What's the most likely reason that a single-sided, single-density, Atari-DOS-2.0S-format autoboot diskette, which works on several different Atari 1050 drives, would NOT work on a SS/SD Percom AT88 drive? The Percom makes valiant but unsuccessful attempts to read the disk, whereas the 1050's boot right into the software. I expect you to say that the most likely culprit is "head alignment in the Percom," but YOU tell ME.

2) Lately I have been experiencing "disappearance" of all peripheral devices beyond the first one (D1:) on my SIO daisy-chain. D2:, for example, will start its motor in response to a DIR D2: command from SDX, but no directory (or any other disk-read) data ever reaches the computer. After a while I get only "device not present" and "device NAK" statuses no matter what operation I attempt. The problem goes away if I reseat the SIO cable coming OUT of D1:, but occurs regardless of actual cable swapping. I hypothesize that it is the SIO _CONNECTOR ITSELF_ on D1: that is the culprit. Can someone tell me if I've overlooked something, or whether I seem to be on the right track?

Thanks for any and all responses; hope you all had a good holiday and everything!

From: Ordania-DM@cup.portal.com
Message-ID: <37340@cup.portal.com>
Source record: 114490

Chris asks about 1050 vs Percom autobooting and about SIO problems...

The Percom (to my knowledge) does not work with "Enhanced" density disks. These are the disks that hold 128k (1000+ sectors) instead of the 90K of single density. I know you said the disk was single density, but you might want to check again to make absolutely sure. The easiest way to check is to use a disk editor program and try to read/write sector 721 - don't just look at the DOS structure on the disk, this isn't reliable. If the disk absolutely, positively is single density, then my next guess is that you are using a commercial software disk of some kind that has a nasty form of copy protection on it. The Percom does not act exactly like a 1050, 810, or XF551 and might fail copy protection checks.

SIO problems are a bitch. If swapping cables doesn't have any effect, swap positions of the SIO units. So, connect computer to D2: to D1: to (something else) and test the something else. If the something else fails then the SIO connector is indeed at fault. To find out which connector is at fault just swap the incoming SIO cable on D1: to the outgoing SIO connector on D1:. If D1: fails, then the incoming SIO connector is bad, if it doesn't fail AND the something else does fail, then the outgoing connector is bad OR both connectors are bad. In some Atari peripherals the SIO connectors were only soldered in and not screwed down. Check inside the drive, and if this is the case, replace both SIO connectors just to be on the safe side.

Organization: University of Nevada-Reno
Keywords:drives, indus, atari, good luck!

Concerning your first question, I use to own an Indus GT it had the same type of problem at times. What it was (an some else eluded to this) that certian software was written to use the speed/timing hole(oops atari never used this) and other sector read techniques that did not always work on all drives.

I had a original copy of Rescue of Fractalas and it didnt work on my indus but a friend brought over the same program but the copy protection was broken on it, and guess what... IT WORKED! probably didnt suprise ya.

No easy solutions on this one, get a different drive I guess.

About the disappering devices after D1:

We had a pin break off in a SIO cable. I guess if we had pressed it
(the cable) into the drive the broken pin's stubbs may have made contact
and worked for a bit... Could be a bad connection from the connector
to the board also... (in the disk drive...)

Goodbye. Philips is having layoffs, and they did it at my site. Only reason that I haven't got told officially yet is that I'm out sick on disability (eye trouble). But several reliable sources tell me that I'm to be canned when I return to work (Jan 2). My normal remote dial-up computer access code no longer works, I'm using a friend's code, at his house. Don't think they can tell whose.

The kind of work I did is television R&D, including HDTV (high defination TV, regular NTSC television, developing patents (I have 11) in this field. Also have done DSP, & high speed digital logic design, up to 114MHz clock speeds. I posted my resume on misc.jobs.resumes Or call me up and I'll mail anyone interested a copy of it, and a list of my patents. Will consider anywhere in USA. Corporations, and colleges (someone at a college called me about 2 weeks ago, call again).
Also give my name and number to any and all headhunters.

Robert Casey Amateur radio WA2ISE
855 Oradell Ave Amateur radio packet: WA2ISE@KD6TH
Oradell, NJ 07649
201-261-4066

Don't try to use e-mail, as Philips is going to delete my computer account the day I get officially canned. I don't expect to be able to log on again.

This is the dark side of American life. But getting layed off is better than getting killed in or near Tianamen Square.

3539. Atari 800XL ...

Newsgroup: comp.sys.atari.8bit
Date: 1991-01-01 17:28:49 UTC
From: mayer@iuvax.cs.indiana.edu
Message-ID: <1991Jan1.122901.22959@news.cs.indiana.edu>
Source record: 114493

This might be an old question/issue, so please respond to me personally at "mayer@iuvax.cs.indiana.edu" ...

I have an Atari 800XL and did a bit of Basic/Pascal/6502 programming on it ages ago, but I'd like to return to playing with it. The following questions come up:

(1) Can I still get a modem for the 800xl? What would its baud rate be? Would something like Kermit65 be the appropriate software for connecting to bboards and getting software?

(2) Is there a C compiler available for the 800XL? I once heard of a pretty good subset of C which didn't support reals, etc. Does anyone know about it? Is it worth bothering with?

(3) I have a cartridge called MAC65 which has a pretty nice Macro Assembler. I heard the same company made another programming lang. for the 800XL which came in a cartridge, and came with a compiler that would produce standalone code. Does anyone know anything about that language? Is it worth pursuing in terms of what the 800xl can do?

(4) If I can manage to get a modem, where could I get software from?

(5) How can I get more memory on the 6502, and what would be the procedure for accessing that memory?

Thanks, Mayer.

3541. re: Vt100 emulator needed

Newsgroup: comp.sys.atari.8bit
Date: 1991-01-02 11:14:12 UTC
From: nin15b0b@merrimack.edu
Message-ID: <20904.2781c085@merrimack.edu>
Source record: 114495

To the person who was looking for a vt100 emulator, if you haven't been able to get one yet, mail me a message and I'll send you a uuencoded copy of K65. Also let me know what kind of modem your using, so I can make sure what I have is compatible.

3542. Re: Two Questions

Newsgroup: comp.sys.atari.8bit
Date: 1991-01-03 19:49:41 UTC
From: Chris_F_Chiesa@cup.portal.com
Message-ID: <37531@cup.portal.com>
Source record: 114496

Thanks to all who've responded to my disk problems, both here and in
e-mail. Haven't had time to follow up on any of the suggestions yet,
but I sure have a healthy list of possibilities!

BTW, several people have suggested copy-protection on the boot disk;
I guess I neglected to mention that I made this one MYSELF, from scratch.
Just DOS 2.0 and my own AUTORUN.SYS file.

Chris

Howdy everyone,

Its finally time to clear out the closet once and for all. Too much
space is being wasted. All items must go!

For Sale: Asking

2 - Atari 1050 disk drives both with $120 ea
Happy upgrades (allows double
density, the ablility to back
up many programs, and to read
and write IBM disks from your
Atari!)

1 - Atari 835 modem (300 baud) $ 10

5 - Atari SIO cables $ 1 ea

2 - Atari joysticks $ 1 ea

1 - Spectravideo Autofire joystick $ 1.50

1 - Printer cable (Atari SIO directly $ 2.00
to a Centronics connector)

Software

Cartridges all $ 2.00 ea

Atari BASIC Star Raiders
Frogger Telelink II
Congo Bongo Linking Logic

Tapes all $ 1.00 ea

Microcomputer games by Avalon Hill
Forbidden Forest
Temple of Apshai Trilogy

Disks all $ 5.00 ea

Silent Service
M.U.L.E
Mortgage and Loan Analysis
Caverns of Mars

Books all $ 5.00 ea

The Atari Assembler
Advanced Programming Techniques for Your Atari Home Computer
Survival on Planet X with the Atari Computer
Master Memory Map
Atari System Reference Manual
800XL Computer Field Service Manual
Compute's Third Book of Atari
Compute's Second Book of Atari Graphics
Atari DOS 2.5
Mapping the Atari (Revised Edition)
The Visicalc Book (Atari Edition)

All prices subject to negotiation (in other words, they could go down). I will be happy to accept the highest offer below my asking price.

Profanity is a feeble attempt to express oneself forcibly

3544. KWEST Atari User Group - ST meeting - Wed Jan 9/91

Newsgroup: comp.sys.atari.8bit
Date: 1991-01-07 19:49:28 UTC
From: daroloso@watmath.waterloo.edu
Message-ID: <1991Jan7.194928.17428@watmath.waterloo.edu>
Source record: 114498
Cross-posted to: uw.sys.atari,comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.atari.st.tech

The Kitchener-Waterloo Eight Sixteen Thirty-two (KWEST) Atari user group,
has a separate 8-bit meeting and 16-bit meeting.
We meet monthly, have special interest groups (SIGs), associated bulletin
boards, public domain libraries, and a newsletter "The Hard Copy".

I am on the executive of the group
so I should be able to handle most questions or
get replies from the rest of executive.

The group welcomes new members and visitors with
8-bits, 16-bits, or those just curious.

Meetings held at the University of Waterloo in the
Math & Computer Building.

Rooms open at 7:00 pm. Meetings start at 7:30 pm.

Call 579-3695 for details.

Next Meetings
****

16-bit (ST) - Wednesday, Jan 9, 1991
DCS Course Room, Room 2009 (2nd floor)

Hope to see you there,
Dani Roloson

From: jorgy@boulder.Colorado.EDU
Message-ID: <1991Jan8.164123.5099@csn.org>
Source record: 114500

Hello.

I was wondering if anyone knows of any games that take advantage of
Atari's Trak Ball in Trak Ball mode.

I already know about Missile Command (the archaic undocumented CTRL-T
feature). Are there any others? I would die for trak ball mode in
Millipede...

MEGA/STE PASSES FCC TESTING
Last week, Atari learned that the MEGA/STe had passed the FCC testing as
a Type B (Consumer) product, and may begin US distribution as soon as
production is ready. That is expected to be in mid-January. This marks
the first time in memory that ANY Atari product has been approved for
consumer release within 30 days of the first product announcement...
(except perhaps for the $29 plastic monitor stand offered last year).

TT BEGINS SHIPPING TO USA DEALERS
Yes, the TT030 machine has in fact begun shipping to US dealers as a
TYPE A COMMERCIAL USE device. The price for the base unit, a 2 MEG RAM,
50 MEG hard drive device, is still $2,995. Only VARs (Value Added
Resellers) and "qualified dealers" can get the TT, and must send Atari
a letter assuring that the machines will not be sold to consumer,
residential users. The FCC is getting concerned with improper sales of
Type A devices, such as the STacy and the TT, and is considering
slapping a $5,000 per machine fine on those sold for improper use.
```

SALERNO LEAVES ATARI
Antonio Salerno, Vice President - Applications for Atari Corporation, resigned last Thursday, December 6. Salerno had been in charge of efforts to persuade major software companies to bring their well known products to the Atari line, and had less than dramatic success. Antonio reportedly will return to school to complete a Masters degree at Stanford University. Atari has no immediate plans for a replacement, as Leonard Tramiel and Atari USA staff members are taking over most of the duties of the position.

BEACH BOY JOINS ATARI
James Grunke, technical man for the super group BEACH BOYS, is leaving the band to replace Frank Foster at Atari as the Music Industry Representative and MIDI promoter. James will begin work on January 1, 1991. Foster left in early September.

FULTON JOINS ATARI
Formerly of NEOCEPT, makers of the powerful WORD UP graphic word processor for the Atari, programmer Mike Fulton has been hired and has begun work in Atari's customer and developer support area. This fuels earlier speculation that Atari may eventually buy and support Word Up as an Atari brand product.

LYNX AT THE MOVIES
A promotion running in 20 premier locations of Cineplex Odeon motion picture theaters across the USA includes an Atari LYNX game kiosk and a sweepstakes for the show-goers. Visitors to the theaters can play the hand-held games, mounted on the display stands. Companion advertising for the LYNX appears in MOVIES USA, a magazine available in most movie houses. The promotion runs throughout December, and Atari thanks a number of user groups who helped set up and are maintaining the displays in areas where local Atari representation needed a hand. Kudos to: MAST (Minnesota Atari ST Users); HACKS (Hooked on Atari Computer Keyboards Society, Glendale CA); HASTE (Houston Atari ST Enthusiasts); SPACE (Seattle/Puget Atari Computer Enthusiasts); NOVATARI (Virginia); Mid-Florida Atari Computer Club. For their efforts, the clubs will get to keep the LYNX machines and the display kiosk.

FLEETWOOD MAC TOUR ENDS; ATARI IS THERE
As a sponsor of the famous FLEETWOOD MAC tour, Atari provided complimentary seats at the final evening of their 1990 tour for several club officials, dealers, and the press. Friday, December 7, the music group that has been pressing hit albums since 1967 visited Los Angeles as the last stop on their tour in support of the latest LP, "Behind the Mask". Fleetwood Mac uses Atari computers to control MIDI keyboards and effects. Drummer and group leader Mick Fleetwood dazzled the sold-out Forum stadium with an extended solo on his MIDI drum-vest, which enables Mick to perform by touching, tapping, or slapping sensors in his clothing. This is the same technology that Fleetwood and Jimmy Hotz use in the HOTZ BOX, which is finally becoming available commercially. This performance is to be the final tour date that singers Stevie Nicks and Christine McVie participate in, although they may continue to be on

Fleetwood Mac albums. Z*NET thanks Atari for being included in this event, and thanks Fleetwood Mac for a great show.

PIRATE GETS 5 YEARS
Dennis Hayes, the Cincinnati resident who pleaded guilty in late October to selling more then 5,000 copies of pirates MacIntosh ROMS was sentenced to 5 years in prison this week. In the original half million dollar chip bust, Hayes sold copied MacIntosh ROM chips for between 130 and 195 dollars per set. Atari users were said to have purchased many of the ROMs for the Spectre Mac Emulator for the ST. Dave Small of Gadget's By Small stated in October that there were many legitimate sources for Mac ROMs and that the marketplace should not be affected by this event.

ATARI ELITE VS ROVAC
Repeated attempts this week to contact Atari Elite's legal representation were unsuccessful and at the present time we still do not have a clear picture of the situation. Rovac's Ron Kovacs received a writ of summons in late November stating that action had commenced on the matter, but to date no further information or summons has been received. Z*Net Online continues to offer the Atari Elite response space to articles we ran earlier in the year.

ATARI EXPLORER UPDATE
The Atari in-house publication Explorer is still around. Production delays seem to be the problem and we have been told to expect release in January 1991.

FIRST VDT SAFETY MEASURES ADOPTED
San Francisco California's Board of Supervisors tentatively adopted on the nation's first active VDT safety regulations. The new regulations would require employers with 15 or more workers to provide a mandatory 15 minute break. Also, adjustable swivel chairs, document holders and computer terminals with detachable keyboards and adjustable, non-glare screens must be supplied. Private and government offices would have two years to comply with the VDT safety rules if the ordinance is approved a second time by the supervisors and signed by San Fransisco Mayor Art Agnos. Late NewsUpdate: This regulation was passed this week and signed by the Mayor.

EUROPE ADOPTS SOFTWARE PIRACY MEASURES
European Community ministers have unanimously adopted new measures to fight software piracy. The measures would grant software the same treatment as literary works, which are protected under the international Berne Convention on copyrights. Copyright holders would have exclusive rights to authorize the reproduction, adaptation, translation or rental of their works.

** ATARI 8 RUMBLES - RAMBLES - RUMORS
==========
by Stan Lowell

It has been much longer than I planned since my last article! Why, you ask? The exact reason seems to have slipped my mind...something to do with formatting a disk(THREE times!). At any rate, here I am again!

Many thanks to those of you who sent me information on GEnie, my BBS, and elsewhere. Your input is a great resource for all Atari 8-bitters!

Among the more interesting messages which I have encountered was the following capture from the ACUTE BBS(215-261-0620). This message was in their networked NEAR-US message base.

Message: 194 (#4903)
Title: 8 Bit Software
Author: Randy Constan
To: All
Posted: Fri 26-Oct-90 at 2:12:00am
Origin: Nest BBS, Long Island, New York

Hi! I just want to tell all 8 Bit users that Elfin Magic Software is still business, and still supports the 8 Bit! While the changing market has made it impractical for me to continue advertising in major publications, I still receive dozens of calls anually from interested users. There's still quite a stock of SUPER 3D PLOTTER II, CIRCUIT DATABASE v.2.3, and CHECKING ACCOUNT MANAGER, on Hand. It's a shame when good software is available, but totally unknown to so many users that could really put it to good use. Our address is:

Elfin Magic Co.
23 Brook Place
E. Islip, NY, 11730
Phone: 516 - 581-7657

Free information on all products is available for the asking, with a SASE. Or, you can leave a message or personal EMAIL, or call any evening after 6:30PM (eastern time), if you need specific questions answered. The revolution lives on! -Randy

After this message there was a discussion of Ads on a BBS. I brought the idea to my Network SysOps. They liked the idea. As a result, we are encouraging 8-bit developers to post information about their 8-bit software on any of our FoReM-XEP boards, in the 8-bit Networked base. Our wish is to get the users & developers together. The current list of FoReM-XEP Network boards follows:

Blank Page BBS - S. Bound Brook, NJ (My Board) 908-805-3967
Gateway City - St.Louis, MO (Support Board) 314-647-3290
Cheers BBS - St.Louis, MO 314-351-2837
Atarian Domain - Orlando, FL 407-855-1317
The Oasis - Kissimmee, FL 407-846-1765
Final Frontier - Philadelphia, PA (Support Board) 215-624-6347
The Boss BBS - Houston, TX 713-479-1967
Manitou BBS - Rochester, IN 219-223-8107
The Magic Dragon - Milwaukee, WI 414-482-2635
The Outhouse BBS - Belleville, IL

The Road to Damascus BBS-Sacramento, CA 916-929-4389

In my last article, I asked for overseas sources for sofware, and I received feedback from Ray Wilmott on my BBS about an overseas source with which he has done business. Their catalog is NOT a slick copy, but a computer printout. Much of the newer sofware is on cassette. According to Ray, their prices are good, and the catalog is free for the asking. Thanks for passing on the information, Ray...

Stan,

Was reading your intro piece in Zmag. You mentioned European mail-order software. Here's the address of the one I've used before in case you want to list it in a future Z-Mag. Please let me know of any others you find...

Miles Better Software
219/221 Cannock Road
Chadsmoor, WS11 2DD
England

-Ray

Several people left me the same names of Businesses carrying software and/or hardware for Atari 8-bits. For simplicity, I have included some messages from my BBS' Networked bases.

Msg# : 1243 - For Sale/Wanted

BOB, you can get 3 I/O cables for $10 (or 1 for $4.50 get the three!) from American Techna-Vision 1-800-551-9995.

I just got 3 and they're good. They ship UPS "land" and it takes 7 to 10 days to receive. Also there is a $4 shipping and handling charge on all orders under all orders under $150. They also have a decent selection of software an reasonable prices and some hardware-parts, i.e. power packs, 1050 mechanisms, keyboards, upgrade kits etc. but no actual computers or drives.

TOM SPENCER

** THE BLACKBOX VERSUS THE MIO
==============================

This article originally appeared in the June 1990 issue of PSAN.

PSAN (Puget Sound Atari News) is the official newsletter of several participating non-profit Atari user groups. Approximate circulation - 800. Please send any inquiries to: PSAN, P.O. Box 110576, Tacoma, WA 98411-0576

BlackBox vs. MIO
by Dan Knauf of S*P*A*C*E

Having had the opportunity to use both the BlackBox from CSS and the MIO from ICD, I thought I would share what I have learned about these two unique pieces of hardware for the 8-bit Atari.

The systems I have used include: 130XE computers (upgraded to 512k), 1-meg MIO, 256k MIO, BlackBox, Supra Modem 2400, Seikosha MP-1300AI printer, 2 Happy 1050 floppy drives, an Adaptec 4000a hard drive controller, 2 Adaptec 5500 hard drive controllers, a Seagate ST225 20 meg hard drive, a ATASI 3046 40 meg hard drive, and a CMI 5616 13 meg hard drive.

An explanation of just what the MIO and BlackBox are is in order. Both include a SASI/SCSI hard disk interface, a printer port, an RS232 port, and some type of printer buffer. The MIO comes with either 256k or 1 megabyte of dynamic ram on board which can be used as any combination of ramdisk(s) and/or printer spooler. The BlackBox comes either with no user ram or 64k of static ram which can be used only as a printer buffer. The BlackBox can also use the standard extended banks of a 130XE as a 64k printer buffer. The RS232 and/or printer ports can be disabled in both units to allow an external device such as an Atari 850 interface to be used.

Both come with clear manuals printed on 8 1/2 by 11 inch unbound paper. The pinouts for all ports are clearly shown in the manuals and there are examples showing how to set up a hard disk system. The BB manual includes several short assembler listings showing some methods of accessing the BB from machine language.

Appearance:

The MIO comes in a nice gray case with the SCSI connector and printer

port on one end. The other end has the RS232 port, on/off switch, power plug, and two LED's - one is a power indicator the other lights up when the MIO is busy. My 1-meg MIO has a second 9 pin plug on this end for a planned 80 column adapter which never happened. The 50 conductor ribbon cable which plugs into the computer is on one side.

The BB comes with no case. Cases are available for it for $39.95 (and they are even black!). On the front edge is the connector which plugs into the 130XE. The other side has the SCSI connector, the floppy controller connector (see below), and the power plug. The printer plugs onto one end and the modem on the other. The BB also has two LED's which serve the same functions as the ones on the MIO.

Plugging it in:

The MIO has a 50 pin connector which plugs in to the parallel expansion port on a 600XL or 800XL. An XE adapter must be purchased for $16.95 to plug the MIO into a 130XE computer. This adapter plugs into both the ECI port and the cartridge port on the 130XE and has sockets for two cartridges on it. The second cartridge plug is primarily for the Rtime-8 cartridge from ICD.

The BlackBox is built to plug directly into the 130XE. It comes with a short 50 pin cable for plugging into an XL machine. No extra adapter is needed. For my own system, I use the XE adapter from ICD and plug the 50 pin cable on the BB into it. (I use the Rtime-8 and this keeps the cartridge stack shorter.)

The MIO has the expected 9 pin and 15 pin d-connectors for plugging in your printer and modem. The BB comes with 34 pin card edges for use with 34 conductor ribbon cable. You can use standard crimp-on connectors for both cables (use 25 conductor ribbon cable for the modem cable) or you can buy the cables you need from CSS.

There is also an unused 34 connection card edge on the BB. This is for the floppy controller that CSS is planning to release. This floppy controller will allow the user to attach industry standard disk drives - up to 80 track 720k - to the BB.

The MIO comes with a heavy duty 9v power supply. The BlackBox comes with a power supply which has +12v, -12v and +5v output. All three voltages are used by the BB.

Menus:

Both the MIO and the BlackBox have menus. Here is a list of options available from the main menu of both:

1) Assign drives as floppy disks, or hard drive partitions. When assigning floppy drives, you can assign any physical floppy drive respond as any drive from D1: to D8: (and D9: on the BlackBox).

Note: On the MIO ramdisks can also be defined. These ramdisks refer to MIO memory only - not memory available inside the computer. Use a DOS ramdisk handler for the extended memory in the computer.

2) Swap Drives - shows up as 'Exchange Drives' on the BlackBox and allows you to swap the drive assignments of two drives. For example, you could swap drives 1 and 4. The drive assigned to D4: would then become logical drive #1 and you could boot from it while the drive that was drive 1 would then be addressable as D4:. I am writing this using PaperClip which I booted from my hard drive using this method.

3) Lock Drive - Write locks a drive if it is a hard drive partition or a ramdisk.

4) Save Congfiguration - this writes the current configuration to the first sector of device 0,0 (the first Hard drive on your system). If no hard drive is present this option does nothing.

The other options available from these menus are different enough to need separate descriptions.

The MIO Menu:

The MIO menu is entered by holding down the SELECT button and pressing RESET. This loads the menu into the computers program ram starting at address $3000. This destroys whatever was there, so it is best to re-boot the computer after accessing the menu. The main menu is the drive configuration menu. This is where you set up your hard drive partitions, partition the MIO ram into ramdisks, and assign floppy drives. The printer and RS232 menus are also accessed from here.

Available from the printer menu:

1 - Pause/Resume Printing.
2 - Clear Spooler.
3 - Print Repeat Copies.
4 - Set Port Type.
5 - Set Spooler Size.
6 - Set Port Number.

The 'Repeat Copies' option allows you to print copies of any text currently in the MIO print spooler. Setting the port type allows printing to either parallel and serial printers. This function is also used to turn line feeds on/off. Spooler size is adjustable in 32k byte increments from 0 (OFF) up to the maximum ram available on the MIO. Maximum available ram includes all ram on the MIO not already assigned to ramdisks. The port number can be set to P1:, P2:, or OFF.

Available from the RS232 menu:

1 - Set Baud Rate.
2 - Set Stop Bits.
3 - Set Parity.
4 - Assign Port Number.

Baud rate can be set from 110 to 19,200 baud. Stop bits can be set to either 1 or 2. Parity can be set to none, odd, even, or space. Since most terminal software handles these items, I am not sure why they are on the menu. Maybe it looked empty without some extra options... :-). R1:, R2:, or NONE are the allowable port assignments.

The BlackBox Menu:

The BlackBox menu is entered by pressing a button on the BlackBox. This menu does not use any programming ram and is therefore non-destructive. You can enter the menu and usually exit with no effect on the program you are running. Available from the BlackBox menu are:

1 - Drive Configuration Menu.
2 - Port Status Menu.
3 - 6502 Monitor.

From the Drive configuration menu you can partition your hard drive, assign floppies, add hard drive partitions to the partition list (explained below), enter the controller menu, or enter the partition list menu.

The controller menu allows you to add up to 8 different hard drives to your system.

The BlackBox allows you to have up to 96 hard drive partitions.

The information on these partitions (size, start sector, controller and drive number, etc) is kept in the partition list. You are allowed to name each partition with any name of up to 11 characters 10 of which show up in the menu. The main configuration table of the BlackBox has room for nine drives (and/or partitions). You can load any partition from the partition list into the main configuration table by going to the partition list, moving the cursor to the partition you want and pressing RETURN. You will then be returned to the main configuration table and asked what drive you want the partition loaded as.

Options on the port status menu are:

1 - I/O Sound On/Off.
2 - RS232 Port On/Off.
3 - Printer Port Number.
4 - Printer Line Feeds On/Off.
5 - Spooler Status.
6 - HD Partition List Start Sector.
7 - Save Configuration.

Yes, I/O sound with a hard drive, heh. The RS232 port can only be turned on/off with no option to be assigned as anything other than R1:. The printer port can be assigned as any one of P1: through P8:, ALL, or NONE. Spooler status cycles between off, XE extended banks, and BlackBox ram (if the ram is available on the BB). This is also where you tell the BB where to look for the partition list which takes up to 14 sectors and can be located anywhere on the first hard disk on the

system. You can save the configuration here as well as from the drive configuration menu.

The 6502 monitor is the best I have seen for the 8-bit Atari. It doesn't have as many features as others but it is transparent to the system and does a MUCH better job of interupting a program than either DDT or Omnimon. I have retired my Omnimon and never used DDT much anyway. With the BB monitor you can interupt a program, examine/change memory, and usually resume right where you left off. Ever had a lockup you couldn't get out of by pressing RESET? With the BB monitor you can change the program counter to point to E477 (the cold start vector) and when you exit the BB the computer will cold start. This is nice for saving the files in your ramdisks.

Note: While snooping in the BB ROM I discovered that holding the HELP key and pressing RESET causes a cold start. Holding SHIFT-HELP does not cause the cold start. This feature was not mentioned in the documentation.

Software:

Other than programs to format hard drives, the only software I am aware of for these devices requires SpartaDOS. There are programs to:

1) swap drive assigns.
2) Lock/Unlock drives/partitions.
3) Load/Save configuration tables from/to disk files.
4) Load/Save BB partition lists from/to disk files.
5) Print info contained in config files and partition list files.
6) Load a partition from the partition list into the configuration table of the BB.

There are also some .CMD files used by BBS Express Pro! sysops to work with the MIO. I am sure there is software available that I don't know about or forgot to mention here.

Miscellaneous:

There are two buttons, two switches, and a bank of eight dip switches on the BlackBox. One of the buttons is used to access the menu. The other dumps the screen to the printer. This can be done at any time. One of the switches allows you to select either text or graphics mode for the screen dump. In graphics mode all Atari graphics characters appear on paper just like they do on your screen. In graphics mode, screen dumps take the full width of 8 1/2 by 11 inch paper. This makes a graphics 0 screen look like graphics 2 on the print-out.

The other toggle switch write protects ALL hard drives. This is handy when you want to try out a new program and don't want it to mess with the hard drives.

The dip switches are used as follows:

1) Force printer fault line to NO FAULT. This causes the BB to not send any data to the printer. You could have another printer interface (and printer) attached to your computer and control which printer prints with this switch.

2) Enable hard disk port/high speed floppy SIO. This allows you to disable access to your hard drives and disable the BB's high speed SIO code for floppy disks.

*3) Enable parallel printer port.

*4) Enable RS232 port.

*5) Enable printer line feeds.

6) Printer is a Prowriter. (Used by graphics dump routine.)

7) MIO compatibility mode where hard drives are concerned. The MIO inverts all data as it writes to the hard drive. In normal mode, the BlackBox doesn't to this. Flipping this switch to the MIO mode allows a hard drive to be used by either the MIO or the BlackBox. Note: this affects ALL hard drives that are online.

8) unused.

* Switches 3-5 are mainly for systems with no hard drives online. If a hard drive is present this info is contained on the configuration sector.

The BB gives more storage capacity on hard drives than does the MIO. It is able to format a drive using 512 byte sectors. These are accessed as 256 byte sectors after formatting. (Each 512 byte physical sector contains two 256 byte logical sectors). CSS claims that using 512 byte sector format can add up to 20% to the storage available on a hard drive. I gained a little over 10% formatting my 40 meg hard drive in this mode. I have a 40 meg drive that formats out as follows:

Format type sectors
MIO - 256 byte sectors 146685.
BB - 256 byte sectors 148994.
BB - 512 byte sectors *162530.

* This is the number of logical (256 byte) sectors.

The only way I have found to empty the printer buffer on the BlackBox is to enter the port status menu and cycle the buffer off/on.

Printing through the Printer buffer with either the BlackBox or the MIO slows down both the printing process and the computer (especially when accessing other devices like disk drives).

Reliability:

The MIO has been plagued by problems and rumors of problems since it was released. I personally know of at least 11 MIO's that had to be sent in for repairs at one time or another. (And I only know 8 people who own

MIO's.) I bought my MIO's second hand and both had been sent back by the original owners to be fixed. Here are some problems I have experienced when using the MIO:

1) Wierd things have happened when I used the printer buffer. Everything from wierd flickering and characters showing up on the screen to garabage being sent to the printer.

2) I could not use my Mac/65 cartridge and the ram in the MIO at the same time. When I tried, the ramdisk(s) formatted themselves whenever they felt like it and I had to use a sector editor to recover anything important. To my knowledge no one else has had this particular problem.

3) When using terminal programs the MIO frequently locked up on me while I was online. I suspect that this is a problem when the MIO is the originator of a call because I know of many BBS's using the MIO that have been online for a long time with no such problem.

Note: BobTerm 1.20 claims to solve this lockup problem by supplying it's own handler for the MIO which also allows it to transfer at a true 19200 baud rate.

I have had no problems with the BlackBox except when I wired it into my 230 watt power supply. I reversed the +12v and -12v lines and fried a couple of chips. A normal person would not have done this.

Product Support:

ICD has apparently lost interest in the Atari 8-bit machines. At this time they offer little support for the MIO. If anything goes wrong, they are not likely to offer any help to the user at all beyond fixing them for $40.00+parts+shipping. My own experience with ICD has left a lot to be desired. I have been using ICD products since about 1984. I use the SpartaDOS X-cartridge and when I first got my MIO, I couldn't exit the menu without the computer doing a cold-start. Thinking something was wrong with the MIO, I called ICD for help. My call was forwarded to to a technical assistance person. I explained my system and the problem to him and he told me that the MIO was faulty and to send it in for repairs. He informed me that the repairs would cost $40.00+parts+shipping. Well, it turns out that exiting the MIO menu with a cartridge plugged in causes a cold-start with all MIO's. So much for getting good help from ICD for their 8-bit products. (In fairness to ICD, I hear that they do a better job supporting their ST product line.)

CSS, on the other hand has proved to be a gold mine for Atari 8-bitters. As I mentioned above, I fried a couple of chips on my BlackBox. I called CSS and (with some embarassment) told Ron exactly what I did. Instead of saying 'Send it in with your wallet, checkbook, and credit cards' he told me exactly what chips I had probably fried. I found the chips at Radio Shack (for about $2.00) and fixed my BlackBox. These

folks really do care!

The people at CSS have answered some pretty dumb questions for me (one or two intelligent ones too). They have even helped people with their ICD products. They have also given me any technical information I needed - or thought I needed - to write programs for the BlackBox.

Trivia:

BB really stands for BobBox. (For creator Bob Puff.)

Conclusion:

The MIO has been plagued with reliability problems. The RS232 handler has been known to cause lockups when online and drops the carrier (hangs up the modem) when RESET is pressed. The print spooler sometimes does wierd things and is only semi-reliable. I have been told that the spooler sometimes writes to hard drives instead of the printer. I kept the spooler turned off when my hard drive was attached. I just didn't want to verify this the hard way. Thee MIO is also known to have (electronic) noise problems, especially when used with 130XE's. The result is loss of ramdisk configuration and/or contents. I have only heard a few complaints about the hard disk interface on the MIO. I have experienced no problems with the hd interface.

Pretty is as pretty does. I have found the BB to be a far more reliable tool than the MIO. It is more flexible in most areas, offers more options, and product support is just fantastic. And it costs less too. The only problem I have heard of regarding the BB had to do with printer dumps when an older Gemini-10X printer was used. A ROM upgrade has fixed this problem. The RS232 handler doesn't cause lockups, and you can press RESET without losing the carrier. I have never had any wierd stuff happen when using the printer handler. I don't have the 64k spooler on the BB but am sure it meets up to the standards of the rest of this fine product. The screen dump feature works well. It will dump any graphics 0-2 screen with no problem and has no problem with most other graphics modes. The hard disk interface works flawlessly and allows use of 512 byte as well as 256 byte sector formats.

The BB also has an MIO compatible mode so that you can use hard drives that have been written to by an MIO. CSS claims that the BB is up to 20% faster than the MIO depending on the brand of controller and drive used. I noticed only a slight increase in speed after converting to BB format using my Adaptec controllers with 3 different brands of hard drives.

I really like the BlackBox. I heartily recommend the BB over the MIO and encourage all 8-bit Atari users to support CSS. After all, they are supporting us.

Now if they would only get that floppy controller out...

The BlackBox - $199.95

** REVOLUTIONARY CONCEPTS
==========
PART 34 - "The Transportable Computer"

by Donald A. Thomas, Jr.
(c)1990, ARTISAN SOFTWARE

(This is PART 34 of a series of articles published and distributed by Artisan Software. Please feel free to copy and distribute this article as you please provided you include all unedited text. Also feel free to upload to boards and communication services. These articles are designed to entice you to take constructive action. Write to involved parties and tell them how YOU feel about the subject.)

NOTE: THIS ARTICLE MAY BE EDITED AND IS ENCOURAGED TO BE PUBLISHED BY ATARI AND/OR OTHER COMPUTER RELATED PUBLICATIONS. SUCH USE OF THIS ARTICLE MUST INCLUDE COPYRIGHT AND AUTHOR DESIGNATIONS AS WELL AS THE NEW PRODUCT RELEASE INFORMATION AT THE END OF THIS ARTICLE.

The Atari Portfolio is a stick of dynamite that has explosive power. For less than three hundred dollars, an individual can obtain a fully functional and programmable MS-DOS command compatible computer that fits in the palm of their hand. Even adding the cost of peripherals, the Portfolio is more than a thousand dollars less than the its nearest competitor- The Poquet computer (retailing at $1999). This is NOT meant to be a sales pitch, it's pure fact. Anyone who has the need for a portable computer can link the Portfolio and quickly transfer compatible data within seconds. Not hours, not minutes, but seconds. And this link is not limited to MS-DOS platforms. Virtually any computer in the world can exchange data with the Portfolio.

The secret lies in two areas. The most significant of the two is the ASCII character set standard. A pure ASCII text file on one computer means exactly the same thing on another. Therefore, the files that are

transmitted between two incompatible computers are 100% compatible. This has always been true, but is now being better understood by more and more people. The second part of this secret is the ease of the physical link.

There is an energy department in Canada which is looking at Portfolios as a remote, unmanned environmental data collecting device. Reporters and photographers are discovering the Portfolios' ideal design for notetaking and scheduling. Salespeople are providing customers with quotes and receipts instantly. Marketing people are compiling statistics with up to a 15 pound lighter load than the laptop alternatives. Hackers like the uninterrupted on-line time since the desktop is difficult to take on vacation. Executives keep in touch with their E-mail and appointments all in one machine. Students find the Portfolio easy to carry between classes. The Portfolio has already proven its broad potential and is fast becoming a trusted tool.

I think the most amazing phenomenon I have encountered in regard to the Portfolio, is how well every platform is quickly learning to make the connection. The Portfolio has already been advertised as "the Portable Mac". Of course MS-DOS users get along fine with it and have since the beginning. Just about every category is covered. Well, except for the Atari ST market. I am simply dumbfounded at how many Atari 16-bit computer users struggle with the Portfolio. Now before you all start writing and telling me you get along fine with it, I am talking general terms here. It seems that the Atari 16-bit community has the most difficult time exchanging files with the Portfolio. Of course, you are probably an exception.

I personally feel that the Atari ST and MEGA computer user should investigate the Portfolio closely, even if it is not purchased. For those who are committed to help spread the Atari namesake around, the Portfolio is the easiest advertisement Atari has ever produced. One of those users referred to above is a broadcaster in the Los Angeles area. I spoke to him one day and he told me he was ready to buy a desktop. He said Memory Cards were beginning to cost as much as one anyway and the Portfolio inspired a confidence in computers. Since he was so pleased with the Portfolio, he wanted advice as to what desktop to buy. I sent him to our friends in Bellflower (Mid-Cities Comp Soft) and this broadcaster is now a proud owner of an ST. The Portfolio is CLEARLY THE MISSING LINK BETWEEN THE REST OF THE WORLD'S COMPUTERS AND THE ENTIRE ATARI LINE.

When I first learned of the Portfolio, I resented Atari's apparent departure from the ST/MEGA environment. I still cringe from time to time to think that Atari could ever decide to abandon their traditional line of computers. It is obvious they will not as they have now the new STEs and TTs being introduced in the United States. As I learned more about the Portfolio, I was amazed at its total function abilities. The Portfolio is enhanced even more by optional software and hardware. I use mine for light spreadsheets, but mostly for writing my thoughts as I

commute to work each day.

I also take it along on business trips for the address book functions. And everywhere I go someone stops and asks about it. If they heard about it, they are amazed that it is exactly as advertised. If they didn't, then they are simply amazed.

If you have been considering to link the Portfolio to an ST/MEGA computer, then read on. It's easy, inexpensive and some fun too. What you will need is the optional Serial Interface and a "DB9 (female) to a DB25 (male) null-modem serial cable". If that sounds like a lot, just know it is a rather standard cable and your computer dealer will know what all that means. The cable should not cost more than $20.

You will also need communications software on the host computer (the ST/MEGA). One popular title is FLASH, but there are many good ones. You will not need a communications program on the Portfolio. Read my lips ... you will not need a communications program on the Portfolio. Make the connections between serial ports using the interface and cable. Run your communications software on the host and designate a TEXT receive. When that is set up, then go to the Portfolio and type COPY FILENAME.EXT AUX. This will issue a copy of your file out through the serial port. To receive a file on the Portfolio, type COPY AUX FILENAME.EXT. Please replace FILENAME.EXT with the true filename.

If you have problems, it may be because you have not initialized the serial interface through the SETUP menu or some parameters are mismatched. The only parameter you will probably need to set is the baud rate on the host computer. 9600 baud is the default on the Portfolio and the suggested speed.

As you become more sophisticated with the Portfolio, you may discover that your file transfer needs have grown. You will need a communication program on the Portfolio if you wish to do non-ASCII file transfers, for instance, ARTISAN SOFTWARE has just released TRANSPORT for the ST/MEGA computers to help you through the confusion. It is written specifically to link traditional Atari computers to the Portfolio. For beginners, an express menu system will enable fast file transfers and display exactly what and when to type the commands you need. Advanced users will learn to access two advanced menu option screens. Included is the ability to generate non-transferrable file reports, strip files on non-ASCII code characters, Xmodem file transfers and much more. It will work on color or monochrome systems and sells for $24.95. You may obtain TRANSPORT from your local Atari computer dealer or you may order direct from Artisan Software. Direct orders must add $1.50 shipping/handling and California must add 6.25% sales tax.

If you desire more information about the Portfolio, consider one of the many Atari publications, visit some users' groups meetings and subscribe to GENIE or COMPUSERVE.

For information on how you can "JOIN THE REVOLUTION" and actively support the exposure of Atari computers, write: ARTISAN SOFTWARE, P.O. Box 849, Manteca, California 95336.

EDITORS DESK
------------> by Ron Kovacs

Well, you couldn't get any closer to the last issue of the year then
this one. 1990 was a busy year for most of us and we continued to watch
the continued shrinking of the Atari 8-bit user base. Strange as it may
seem, we are going to continue for atleast another year with this
publication and hope for the best.

There are a number of topics and directions we are going to embark on in
1991 and we are really going to be looking for your support. The KIDS-
91 project is a new idea which we recently learned about and it is
discussed in this edition. Also, the phone company wants more of your
money and if you are a BBS sysop, you should read with great interest,
the developing story about the Indiana and Michigan Sysops in this
issue.

This is issue #189, we start 1991 and begin our 6th year of Atari
online publishing. For those of you who don't know, our first local
Z*Magazine issue appeared and was published in May 1986 on the Syndicate
BBS now called Z*Net Online. Our regularity has been cut way back
because of the lack of Atari 8-Bit specific news, but we hope to provide
more in the year to come.

In this edition, a full year in review of Atari appears. I know it is
NOT Atari 8-Bit exclusive, but it does give a good retrospect into the
past year. Also, this is a large edition which will present and use all
of the material we have saved so that we can start the new year with
fresh material.

Stan Lowell and myself will continue to peruse the message bases and
networked areas we are involved in. For the latest when it happens, you
can always read Z*Net Online Magazine, get involved with the FoReM XEP
```

network that Stan is involved in, the FoReM/Turbo Crossnet (FNET) areas I am involved in and the pay services. We are going to focus some of January on the ST and 8-Bit BBS Networks available.

As in the past, I want to thank everyone who has assisted ZMAG throughout the year. Although we only returned in September, there are many to thank for the support and information presented here in each issue. Special thanks go to Stan Lowell for his continued enthusiasm and support of the Atari 8-Bit computer.

Happy 1991 everyone!

1990: THE OF ATARI IN REVIEW
============================> by John Nagy

1990... was it the year of Atari? It was a year filled with hope and with disappointment. It was a year of promises and some fulfillment. Lets look at the highlights and the lowlights together.

Computer years tend to be measured from Fall Comdex to Fall Comdex rather than from the more traditional calendar. So here is a chronology of Atari since the Comdex last November 1989, up through the recent Comdex, to the end of 1990.

I've focussed on Atari and added only a few major third-party announcements. While I know some folks will feel slighted by being omitted, sorry. I'll be blaming it on the editor. (Grin!)

NOVEMBER 1989:

Sig Hartmann retires after 5 years as front man for Atari.

Comdex - the US marketplace of computers, attended by the industry bigwigs, dealers, and distributors who are deciding what lines they will buy and sell in the coming year. In the Las Vegas convention facilities Atari Corporation occupies a spot near the main entrance where they seem to sit as a foothill to the towering ZENITH and IBM exhibits just behind it. Atari has perhaps their best looking booth ever, in light colors with open feeling displays. "A Computer For Everyone" declares the overhead sign, and from the brand new palmtop Portfolio and STe to the TT (being shown in production prototypes), Atari draws lots of attention. Carrel after carrel of major third party developers each show their own lines to thousands of intrigued visitors. The STacy and Portfolio are the clear eye catchers. Over 1,000 potential distribution contacts are made for the Portfolio alone. Bob Brodie is popular already in his second month at Atari. Charles Cherry, only two weeks with Atari after leaving ANTIC Software, begins his effort to support developers in new and attractive ways, including SOFTSOURCE and distribution of dealer and user data. The mood is very up - this seems to signal a new and forward moving atmosphere at and for Atari.

The Independent Association of Atari Developers (IAAD) is formed by 40 developers at the WAACE Atari show outside Washington, DC. Nathan

Potechin of ISD is the first Chairperson.

ST-LOG and ANALOG magazines merge, then announce that the November 1989 issue will be the last of any Atari magazines from Flynt Publications. START magazine loses Andrew Reese and editor and Tom Byron takes over, and ST-XPRESS closes altogether.

GADGETS BY SMALL begins distribution of the GCR Mac Emulator, enabling the Atari ST to not only run MACINTOSH software faster thana MAC, but read and write real MAC disks... faster than a MAC.

PC-SPEED, an internal IBM emulator board from Germany, is in distribution by MICHTRON, while AVANT-GARDE is unable to meet release promises with PCDITTO II, a hardware PC emulator first shown in April, 1989.

DECEMBER 1989:

Mike Morand, President at Atari for only two months, resigns. David Harris in named as his successor.

Greg Pratt, Atari's Chief Financial Officer, continues the search for a buy for the FEDERATED GROUP store chain that has drained Atari's working capitol.

The FCC passes the STACY laptop ST as a "TYPE A" device, meaning that it can only be sold as a commercial device, not in outlets for the home users. Battery operation time is admitted to be about 15 minutes for units with hard drives.

JANUARY 1990:

The LYNX is a major hit at the Winter Consumer Electronics Show in Las Vegas. Nintendo is the clear winner in volume and promotion with the Game Boy, but the LYNX wins hearts with astounding color graphics in a hand held machine. Private showing of a prototype portable machine from NEC causes worry that the LYNX will be passed up by this newer unit by Christmas 1990.

QUICK ST goes from shareware to commercial, as Darek Mihocka begins a trend in small developer success stories.

ZMAGAZINE and ST*ZMAGAZINE merge to become Z*NET ONLINE, a single weekly electronic publication covering the entire Atari computer lineup. So begins the fifth year of the continuing, volunteer, non-profit Z*NET project.

Avant-Garde's PCDITTO II begins actual shipment, but less than 10% of the users can make it work, and it turns out to be so large that only MEGA machines have room inside for it.

TALON announces that they will begin importing the SUPERCHARGER external IBM emulator that will require no installation at all.

FEBRUARY 1990:

Jack Tramiel, "retired" controlling stock owner of Atari and chair of the Board of Directors, takes a more active hand in Atari policy and management.

A $5,000,000.00 backorder backlog that has had some items (like Monochrome Monitors) unavailable for five months begins to ease as Atari hardware shipments arrive at dealers.

Rumors begin to circulate about a new version of the MEGA computer that may be based on the STe and card-compatible with the TT.

Atari makes an impression at the National Association of Music Merchandisers (NAMM) show as the only major computer display. The Hotz Box and the STacy are featured, and a concert is sponsored by Atari.

MIDI-TASKING is released to developers as a BETA-TEST version, offering a multitasking environment under GEM, tailored for MIDI applications.

MARCH 1990:

Layoffs of 15% of the Sunnyvale Atari employees affect mostly warehouse and accounting departments, but are felt by all.

After some angry power plays and short-scheduled events by commercial promoters that appear to be trying to squeeze user groups out of show production, Atari announces that they will not support Atari Fests that are not scheduled at least 120 days ahead of time and that are closer than 30 days to any other show.

Charles Cherry's SoftSource system of cataloging and promoting third-party developers nears readiness on GEnie telecommunication system.

FEDERATED is finally sold, the last parts going to SILO's chain of stores in a deal that gives Atari a large block of the huge UK company's stock.

Avant-Garde releases a series of fixes and chip replacements that make PCDITTO II work... for as many as 80% of the owners.

CALAMUS OUTLINE ART begins shipping from ISD. It comes with a conversion program to turn Outline format graphics into PostScript files.

APRIL 1990:

ATARI EXPLORER MAGAZINE editors David Ahl and Betsy Staples are fired by Atari, the publisher, for their critical commentary in the "Spring" issue. The issue is recalled before distribution and reworked.

The second Disneyland World Of Atari is a moderate success, with showings of some new products. Gadgets's 68030 upgrade board is shown - working - and might even be faster than Atari's own TT.

The STe finally passes the FCC testing and can begin distribution in the USA.

MICHTRON releases FLEET STREET PUBLISHER 3.0 without fanfare, as Michtron begins winding down operations and discussing a possible sale. They continue to appear at shows with great deals.

The Business Software Alliance (BSA) raids an Atari Taiwan plant and finds several pirate copies of LOTUS on employee machines. Atari denies responsibility and criticizes BSA priorities.

A two-day Atarifest in Pittsburgh, PA sponsored by PACE is a resounding flop, with well under 500 attending. Worse, comments from many visitors cause fears about the rampant and apparently accepted level of piracy in the area. Discussion of the situation online and in media reports infuriate local groups.

MAY 1990:

At Atari's annual meeting, shareholders learn that the company has earned $1.5 million in the most recent quarter, and sees the TT.

Jim Fisher is announced as the new editor of Atari Explorer, adding to Jim's duties as Vice President of Marketing. Production will be handled by Jon Jainschigg, formerly the technical editor of Explorer under Staples and Ahl.

World of Atari Manager Richard Tsukiji relights old fires by announcing a WOA in San Jose less than a month before the Glendale Atari Faire, defying Atari's guidelines for show scheduling. A similar announcement in 1989 caused cancellation of BOTH shows. This year, neither plan to back down.

ST JOURNAL, from Steve Lesh and Quill Publications, begins distribution of their first issue. The new ST specific magazine attempts to provide a serious user's journal of news and reviews, avoiding the "game" image entirely.

JUNE 1990:

The Summer CES in Chicago was attended by Atari but no new hardware or packages were offered. The long talked about "Atari Advantage" package (a bundle of LOTS of game and productivity software with a 520ST ad a very low price) was prepped then pulled out of the CES show at the last moment. The Tramiels are rethinking the contents and pricing of the bundle(s).

ELIE KENAN comes to Atari from his position as Manager of Atari France, to begin preparations for his takeover of Atari USA, Canada, and France.

The STacy and STe begin shipping to Atari dealers in the USA.

Atari co-sponsors the "Silicon Summit", trade talks with the Soviets concerning a trade of computers for RAM CHIP production in the USSR.

WOA promoter Richard Tsukiji is informed by Atari that Atari will not participate or support his San Jose show in any way, due to his late and conflicting scheduling of the show.

GRIBNIF shows their NEODESK 3 for the first time, offering lots of remarkable advancements in their ST desktop replacement.

ICD Inc. offers new driver software for their hard drives and host adapters that resolves a major incompatibility with Talon's Supercharger IBM emulator.

JULY 1990:

Dealer information from New Zealand and the Netherlands indicate that the Atari TT030 machine is being redesigned to be 32 Mhz rather than the 16 Mhz as announced. Atari USA and Atari Corp both deny the story.

Atari USA is said to be looking at relocation sites in BOSTON as a place to move to from Sunnyvale, CA. Incoming manager Elie Kenan is being offered a free hand by the Tramiels, and is thought to be looking for a way to separate Atari USA and Atari Corp, now both based out of the same Sunnyvale building.

Additional layoffs occur at the line level at Atari, fueling relocation rumors.

A replacement for the SLM804 Atari laser printer is expected shortly. It will be a essentially a standard Epson unit, customized for Atari.

The old SLM804 unit can no longer be obtained from the manufacturer.

The STe is troubled by recurring reports of loss of data when used with a hard drive. Some stores test and find their entire shipments will not operate with hard drives. Atari denies that it is a systematic or design problem, but agree to replace any units found to be inoperative regardless of age or having been opened for inspection.

A fraudulent FAX message purporting to be from Bob Brodie is received by MICHTRON and GADGETS BY SMALL, urging them to join a "boycott" of the WOA shows. Meanwhile, Atari reverses its decision and agrees to provide equipment as possible for the August WOA in San Jose.

AUGUST 1990:

San Jose WOA succeeds with a small but happy turnout of 1,500 people. Many Atari officials attend, including Sam and Leonard Tramiel and Elie Kenan. Atari supplies free equipment, but WOA refuses to participate in its safe return. Bob Brodie personally picks up the equipment and overhears promoter Richard Tsukiji discussing his plans to "have Brodie fired" from Atari.

Second quarter net income for Atari: $1.5 million.

Charles Cherry resigns from Atari. Developer projects are left partially on hold, and SoftSource is stalled while many developers ask for extensions of time to get the required submissions. Meanwhile, other developers complain that they got their materials to Atari on schedule and don't want the project delayed.

START MAGAZINE announces that they will skip their September issue, then join with ANTIC into a single, larger publication for October 1990 in a major redesign and rededication of the magazine.

Gordon Monnier of Michtron confirms that he has his company for sale. George Miller, Michtron's #2 man, leaves to join ABACUS, a book and software house in Michigan.

B. N. GENIUS, an upscale gadget store with a major mail order following, features the Portfolio on the cover of their national catalog. Atari dealers are concerned about losing business.

Atari attends GENCON in Milwaukee and provides major equipment and floor presence. About 10,000 visitors witness Atari as a major "player" in the gaming convention.

Frank Foster resigns from Atari in a mutual decision that leaves Atari without a leader of its MIDI support section.

42,000 visitors attend an all-Atari show in Duesseldorf, Germany. The TT and ATW are major features, and developers from all over the world convene to maximize their sales potential.

Hong Kong's largest English magazine, the "NEW STRAITS TIMES", conducted a reader survey and 41.8% of the votes declared the Atari ST to be their choice for "Computer of the Decade". Second place went to the Commodore Amiga with only 5.2%, third was the Macintosh with 5.1%, tied with the IBM.

SEPTEMBER 1990:

Glendale has the largest Atari Show ever in the US measured by number of vendors, but turnout is a somewhat disappointing 2,500. The user-group show is supported by over $20,000 of advertising by Atari Corp, extensive equipment supplies, and a full house of Atari executives and employees visiting and hosting the Atari area of the floor. Leonard Tramiel personally participates in two seminars. New Manger of Atari USA, Canada, and France Elie Kenan meets and shares his plans for Atari in private meetings with each developer during the show and gets a unanimous if cautious "thumbs up" from them.

Atari formally announces new specs for the TT030 - it will be 32 Mhz after all, despite the denials, and will feature a new GEM desktop that looks similar to Gribnif's NEODESK 2 but is not related to it.

After a multi-party investigation, Richard Tsukiji is forced to admit in writing that the fraudulent FAX message that defamed WOA and ST World Magazine in Bob Brodie's name did in fact come from his own office at ST WORLD. Tsukiji adds it was sent by persons unknown at a time when he himself was out of the country. Dave Small resigns from ST WORLD staff in protest. ST WORLD magazine is announced to have been sold in mid summer to its staff for the sum of $1.00, but not to its editors who had expected to be given the magazine. They leave in protest.

The STe hard drive problem is fixed. Any existing STe computers should be checked for proper operation with a hard drive and returned for repair or exchange if they fail. Atari does not formally announce this event, as they do not concede to the fact that the problem existed in the first place.

ICD Inc. introduces ADSPEED, a 16 Mhz accelerator board for ST and MEGA computers that features faster operation and 100% compatibility with existing software. $300.

Gribnif starts sales of NEODESK 3, selling out at Glendale.

TALON is rumored to be considering the purchase of MICHTRON.

The Atari Elite, an organization of Atari owners in Pittsburgh, PA, threatens to sue as many as 33 persons, developers, and publications for allegedly defaming their group in news coverage and commentary about the PACE show in April. Z*NET and editor Ron Kovacs is among them. Elite's commercial software rental library is a major discussion point in allegations of organized or permissive piracy.

OCTOBER 1990:

WAACE holds its third DC ATARIFEST and attracts 2,000 people to a wide display of Atari and third party developers. Sales are in record numbers for attending vendors, and Atari provides similar backing to that of the Glendale show a month earlier. Elie Kenan again attends and meets with developers.

Bob Brodie meets with ELITE members at WAACE to attempt to resolve their concerns and stem their threatened lawsuits. No immediate solution seems at hand as the parties assume a standoff position.

Elie Kenan leaves Atari USA and Canada to return to Atari France. In the single most devastating blow to Atari morale in years, the departure of Kenan is met with disbelief and denial in the Atari community. Details are of course not released, but Kenan left after a meeting with Jack Tramiel immediately upon Kenan's return from Boston, where it is thought that he was choosing a relocation site for Atari. Greg Pratt, formerly in the Atari financial division, is named General Manager of Atari USA.

Jim Fisher, Atari's VP of Advertising and Marketing as well as the official editor for Atari Explorer Magazine, resigns in an decision unrelated to Kenan's departure.

Atari Canada now includes Neodesk 3.0 with every ST or STE sold.

A new color monitor to compliment the STE's stereo sound is released in Canada, tagged the SC1435. The monitor is not a re-structured SC1224 as was first thought but of a completely different design with a larger screen.

Both Fast Technology (Jim Allen) and Gadgets by Small (Dave Small) show 68030 boards INDEPENDENT from one another at WAACE since a splitup this

summer. The COMPLETED Gadgets 030 board contained 8 megs of on-board RAM (boosting a Mega 4 to 12 megs of RAM total) as well as a 68882 math co-processor, all running at 18.4 mhz (it can run it up to a max of 33 Mhz). The board has TOS 1.6 on board, with Atari committed to licensing TOS 1.6 to Gadgets for use in the board. It can run 10.66 times the speed of the standard ST at 16 mhz - using most existing ST software. Price and availability cannot be set until Gadgets get quantity pricing on parts.

NOVEMBER 1990:

Atari Stock trades at prices as low as $1.75 on the American Exchange. This is down from a peak of nearly $20, only 18 months ago.

After a five year-long effort the Software Protection Association was pleased to see the passage of a bill that makes software rental (other than non- profit library loans) programs illegal. One hour and a half before Congress recessed to start campaigning for reelection, the so-called "software rental bill" was finally passed. The bill makes it illegal for companies to rent software in a manner that allows users to copy and keep the program then return the original disks and documentation for re-rental.

Computer Shopper Magazine, a 800 page monthly magazine that once covered all computers, drops regular Atari coverage. Amiga, Mac, and IBM remain.

START magazine announces that beginning in December, the Z*NET News Service will be included in every issue. START ONLINE replaces the dormant ANTIC ONLINE on CompuServe, offering reprints of articles and featured software.

A file called "TOS 2" circulates on private bulletin boards. The program provides an early version of the new TT Desktop which will operate on an ST. Atari reminds users both that the file is a STOLEN, PIRATED file that belongs to Atari, and that it is an early version that is known to be incomplete and unstable.

Atari says they will have the TT READY FOR SHIPPING by COMDEX, with retail pricing for the base TT030 (2 meg RAM and a 50 megabyte hard drive) of $2,995 plus either $450 for a multiresolution color monitor, or $999 for the new 19" monochrome monitor.

COMDEX arrives at Las Vegas, and Atari has the biggest booth yet. The MEGA/STe is introduced, featuring the TT look, LAN ports, 16 MHZ, built in hard drive, and the new TT desktop. Availability is planned for January, with new retail prices basing around $1,700 for 2meg RAM, 40 meg HD. The new monitors are shown, and a Scalable GDOS is demonstrated for imminent release. The TT030 is still shown but not available due to engineering changes that have prevented FCC testing. Most of the crowds pass up the ST line to see the Portfolio. MANY dealers ask to carry it, and some agree to offer the entire line. Eight bundles are announced, offering a variety of software with computers at savings over retail.

MICHTRON is sold to a Newark, Delaware company, who will take over support and sales for the remaining Michtron products. PC-SPEED and AT-SPEED are taken over by TALON, and the HIGHSOFT line is apparently being marketed by GoldLeaf.

MIGRAPH announces a Color Hand Scanner, to be available for the ST line in early 1991. It will require a minimum of 2 meg of RAM, and will benefit by the added speed of the Mega/STe or TT.

DECEMBER 1990:

Atari Corporation reports a third-quarter (ending Sept. 30, 1990) net income of barely over three million dollars on sales of $89 million, compared to a loss of $5 million on sales of $81 million for the same period last year. This year would have been a $3 million loss except for an offset of a $6 million gain from Atari repurchasing debentures at a favorable term. Net income per share is $.05.

Downscaling hits Atari magazines overseas as well as in the USA. ST WORLD (UK) drops its publishing schedule back to QUARTERLY releases.

An Atari emulator for the Amiga computer continues to draw comment and fire as it develops. Purporting to be "public domain", the file "ATARI1" (now in general BBS distribution worldwide) includes illegal copies of TOS and GEM internally. Reports are that the thing actually works, at speeds up to half of that of an Atari, although desk accessories do not work, and many, even most common programs do not operate. Screen appearance is also said to be very poor. Atari's stance continues to be that this file is a violation of Atari's copyrights, and that distribution will not be permitted.

Atari's new MEGA/STe passes the FCC testing as a Type B (Consumer) product, and will begin US distribution as soon as mid-January. This marks the first time in memory that ANY Atari product has been approved for consumer release within 30 days of the first product announcement.

The TT030 machine begins shipping to US dealers as a TYPE A COMMERCIAL USE device. The price for the base unit, a 2 MEG RAM, 50 MEG hard drive device, is still $2,995. Only VARs (Value Added Resellers) and "qualified dealers" can get the TT, and must send Atari a letter assuring that the machines will not be sold to consumer, residential users.

Antonio Salerno, Vice President - Applications for Atari Corporation, resigns. Salerno had been in charge of efforts to persuade major software companies to bring their well known products to the Atari line, and had less than dramatic success.

James Grunke, technical man for the super group BEACH BOYS, is to leave the band to replace Frank Foster at Atari as the Music Industry Representative and MIDI promoter. James will begin work on January 1, 1991.

Formerly of NEOCEPT, makers of the powerful WORD UP graphic word processor for the Atari, programmer Mike Fulton is hired and begins work in Atari's customer and developer support area. This fuels earlier speculation that Atari may eventually buy and support Word Up as an Atari brand product.

Dennis Hayes, the Cincinnati resident who pleaded guilty in late October to selling more then 5,000 copies of pirates MacIntosh ROMS, many of them to Atari users for MAC emulation, is sentenced to 5 years in prison.

Until December 31, 1990, Atari Canada offers a $450.00 trade in on any 520 or 1040 towards a new Atari TT. Trade in machines will be refurbished and given to charity or used in an educational program. U.S. customers wishing more information can call (604) 275-7944.

THE FUTURE...

If 1990 was the Year of Atari, what will 1991 be? While there is reason for optimism in the new products and new staff at Atari, users and developers continue to leave the fold for apparently greener fields of MACs and 386 clones. Others are holding the course, hoping for better days ahead within the Atari line.

What will come next for or from Atari? It is clear that the most outside interest is now being generated by the Portfolio and the LYNX. While we ST types may feel left out, it is just as clear by recent events that Atari intends to build and support the ST/TT platform for some years to come... and if that support is funded in part by sales of the MS-DOS style Portfolio and the game consoles, so be it.

New products to come? There is considerable talk about a new 68000 based game machine called the PANTHER. This is NOT expected to be an ST compatible or any derivation of the existing lineup. When? Maybe mid-'91. And what about the Unix-compatible TT with multiple slots? This was known as the TT/X (eXpandable) as compared to the TT/D (Desktop) machine in press information gone by... but has the concept also gone by? A smaller, cheaper version of the LYNX handheld game unit is also still being promised... for SOMETIME. A new remodeled STacy is also rumoured in 1991.

We have no firm predictions to offer for what will or will not eventually come in 1991. But here's hoping that we will all be here a year from now, wondering about '92!

Z*NET NEWSWIRE
==========

PRODIGY AGREES TO REFUNDS
Prodigy, a computer information service, agreed this week to refund four months of fees to Texas subscribers who want to cancel the service. Prodigy was accussed by the Texas attorney general's office, of misleading customers about its costs and services. In an agreement, Prodigy said it would "clearly and conspicuously" disclose all fees in

future advertisements.

VENTURA PUBLISHER SHIPS
Ventura Software announced late this week that it has begun shipment of Ventura Publisher, OS/2 Presentation Manager Edition, a new version of the company's desktop publishing software running under IBM's OS/2 version 1.3 Presentation Manager operating environment. This new product will be distributed to major resellers nationwide.

NEW 908 AREA CODE
New Jersey's new area code (908) will make its debut on customer bills next month. Beginning with bills mailed Jan. 3, customers who are located in the 908 area or those who make calls to 908 numbers will see the new area code on their bills. Customers who dial incorrectly after the new code becomes mandatory on June 8, 1991 will hear a recording with dialing instructions. The 908 area includes all of Warren County and almost all of Union County. The parts of Hunterdon, Middlesex, Monmouth, Ocean and Somerset counties that currently are 201 will become 908, as well as small portions of Sussex and Morris counties. The 609 area remains unchanged.

SAN FRANCISCO PASSES VDT BILL
Last week we reported that San Francisco California's city supervisors had been deciding upon a measure to protect users of video display terminals, (VDT). The bill, approved over the protests of business leaders, now goes to Mayor Art Agnos for signature. The measure mandates adjustable chairs, special lighting and rest breaks. Affecting all city government and businesses with 15 or more employees, the bill also requires glare shields, detachable keyboards and tables with sufficient leg space. If signed, companies have two years to implement the provision, after which violators could be fined up to $500 per day. The Mayor has ten days to decide and sign the provision.

FCC LEVIES FINES
The FCC has levied fines totalling $200,000 against computer equipment vendors who attended last month's Comdex trade show in Las Vegas found violating FCC rules. The FCC made 300 inspections affecting sale of personal computers and peripherals that violated FCC marketing rules. Violations cited were vendors who didn't display FCC ID numbers and others who allegedly rushed new uncertified products to market while competitors were waiting for FCC certifications of their products. A list of those fined is not available.

COMPUTER RULE CHANGES
A proposed FCC rule change could affect the cost and availability of motherboards for personal computers. The FCC is involved with certification programs for computers because the devices can emit radiation that cause electronic interference. The FCC requires that computer systems marketed for home use must meet Class B certification requirements. Class B specifies that emissions have to be of an intensity low enough not to disrupt communications on a wide range of frequencies. Currently, complete systems and some peripherals such as

accelerator cards and video boards must be certified. However, the FCC is considering a change in the classification of motherboards to require they be certified individually. Under current regulations the boards are considered subassemblies not subject to certification. The FCC invites comments on the proposed rule change. Those interested who want to submit comments to the FCC should do so now since the first round of hearings were held last week. Comments on the proposed certification of RCPU boards (motherboards) should refer to RGen Docket No. 90-413S and should be sent to: Office of the Secretary, FCC, Gen. Docket No. 90-413, Washington, DC 20554.

NEW VIRUS UNCOVERED
A new computer virus has been found in the Apple Mac. The virus, called ZUC B, forces the computer's cursor to drift across the screen. When the virus finally reaches the Mac's Finder software, cursor control becomes impossible.

HOTZ GETS RIGHTS TO MARKET BOX
Atari has reportedly given Jimmy Hotz the rights to marketing for his full-size Hotz Midi Translator, also known as the Hotz Box. This $5,000 and up unit is designed for professional studio and tour use, and it is expected that Jimmy will be better able to promote and sell it at on his own to fellow musicians. Atari will retain the rights to marketing any consumer version of the controversial device that allows anyone, even a child, to free-style solo with or accompany pre-recorded music without a sour note... sort of the ultimate in a chord organ. Jimmy will once again join Atari at NAMM, the National Association of Music Merchandisers show this coming January 18-21.

FLEET LEAVES THE STREET
MIRRORSOFT of the UK has announced that FLEETSTREET PUBLISHER is being pulled off the market due to poor sales. Most other Mirrorsoft productivity titles were transferred to other lines, like MICRODEAL, but Fleetstreet was not, and has an uncertain future. Fleetstreet Publisher, recently in version 3, was marketed in the USA by MICHTRON, which also recently changed hands.

YET ANOTHER REPLAY
MICRODEAL, one of Michtron's main import lines, has announced REPLAY 8, replacing Replay 4 as an amateur musician's sound sampler and editor. It will feature some of the enhancements of Replay Professional. USA availability is not yet known.

ST WORLD GOES QUARTERLY
Downscaling has hit Atari magazines overseas as well as in the USA. ST WORLD (UK) has dropped its publishing schedule back to QUARTERLY releases.

BRODIE WRITES FOR START MAGAZINE
Atari's Manager of User Group Services Bob Brodie will begin a continuing column for STart Magazine, the largest US Atari specific magazine, in early 1991. His articles will be general interest items,

with accent on user groups and how they help owners get more from their Ataris.

MIGRAPH NEW TOUCHUP VERSION FOR TT/STE
Mentioned in earlier issues of Z*NET, the Migraph Hand Scanner, Touch-Up, and Easy Draw are parts of one of the new STe bundles. We didn't mention that TOUCH-UP is going up to version 1.6, and features new abilities to save a true grey-scale image in TIFF format. However, the new features require the extended palette of the STe or TT for full use. Older ST units will not have access to all the new features of the upgraded TOUCH-UP software.

REVOLTUIONARY CONCEPTS - 1991
==========
Press Release

IT'S HERE!

Manteca, CA -- Just Released! The REVOLUTION HANDBOOK is now available in paperback. Designed to appeal to two distinct markets, the new REVOLUTION HANDBOOK creatively appeals to potential new computer buyers and the powerful existing base of enthusiastic Atari computer users. The book combines the best aspects of the 16-bit disk-based version released in the second half of 1989. In addition, 7 new informative chapters have been added to assist computer buyers in their efforts to shop for the optimum computer.

Author, Donald A. Thomas, Jr. indicates that the time has come to offer a printed version which can benefit everyone... not just 16-bit Atari computer users. Now it is easier than ever for 8-bit and non-Atari computer users to appreciate the swelling movement designed to improve the public awareness of one of the best computer alternatives available in the U.S. marketplace. The illustrated book was entirely published using the Calamus desktop publishing system and artwork was scanned using the Migraph hand scanner... providing a formal testimonial to the impact of a low-cost, yet powerful computer configuration.

Beyond the offering of a user-friendly guide to computer shopping, the latter portion of the book offers numerous suggestions and ideas that existing Atari users can economically implement to show their endorsement of their favored computer choice. Such ideas specifically address teachers, users' groups, individuals, publications, sysops, celebrities, dealers and more. A helpful index references key words throughout the book to help newcomers learn to understand the terms many of us take for granted.

Noteworthy contributions include a Forward by Robert G. Brodie, Manager of User Group Services of Atari Computer Corporation. D.A. Brumleve, San Jose Computers, Atari Explorer, ISD Marketing, Shareware Connection and Computer Studio also helped by contributing advertisements to help offset initial expenses of producing the book. In addition, the publisher wishes to thank the many patient pre-orders, all of whom

helped to make the book possible.

Dedicated to the Atari Computer Users of North America, The REVOLUTION HANDBOOK is one more statement of Artisan Software's commitment to the Atari line of computers. Its use as a multifaceted tool will help to fuel the energetic forces targeted for productive use of the Atari computer.

Look for The REVOLUTION HANDBOOK at better Atari Computer dealers or order a personally signed copy direct from Artisan Software. Send $14.95 (U.S. funds plus $1.50 shipping and handling) to Artisan Software, P.O. Box 849, Manteca, California 95336. California, add 6% sales tax. One Dollar of each book sold will be contributed to Atari to purchase Atari computers for schools.

Look for REVOLUTIONARY CONCEPTS, a continuing series of articles in support of The REVOLUTION, distributed through GEnie on-line services and picked up by Atari journals and bulletin boards everywhere!

Z*NET NEWSWIRE - PART 2
==========

ATARI YEAR END SPECIAL
Atari is presently running a "Year End Special" through midnight, December 31, 1990. If you purchase six 1040 STe's, you will receive either one free SC1435 Color Monitor, or TWO free SM124 Mono monitors, dealers choice. In addition, if you purchase six 520 STs, you will receive a free SM124 mono monitor. This special is exclusive of all other promo's currently in place. You have the option to either purchase existing promos, or the above mentioned year end special or any combination. For further information, contact Sales Administration, or your local rep.

CHICAGO ATARIFEST UPDATE: ERRATA
In Issue #546 of Z*Net Online, we listed vendors and developers who attended the Gurnee Atarifest. We failed to list others in attendance who assisted in making the event a success. Those omitted were:] Namely Computer Cellar, Mars Merchandising, Kolputer Systems, and Paper Express. We apologize for the omission.

Z*NET GERMANY
==========
by Michael Schuetz, Contributing Editor

As Z*NET reported this fall in a totally surprising newsbreak, Elie Kenan, who had stirred so many hopes in North America left the US in October to go back to France. Up until now no official confirmation or comment has been made by Atari USA. Now just before Christmas there comes another newsflash - this time out of Atari's stronghold in Europe, GERMANY!

Word is being spread in Germany that the head of Atari Germany, Alwin Stumpf, will pick up the work where Kenan has stopped. It is said that

he will leave Europe in a few weeks to go to North America. At first he is supposed to stay there approximately a year. Again - no official comment or confirmation is available from Atari, but one of Germany's most reputated newspapers, the Frankfurter Allgemeine Zeitung (FAZ), had a big article about Atari in its issue from Thursday, December 20th, 1990. The article covered several aspects about Atari in Germany, among them the story about the KAOS TOS 1.4.2 and last but not least it was mentioned that Alwin Stumpf will move to Canada shortly to steer the matters of Atari in North America from there.

Stumpf switched from Commodore Germany to become the head of Atari Germany shortly after Jack Tramiel had taken over Atari in the middle of the 80ies. May be he will be able to turn around the situation in North America to Ataris favour. It is no secret that Germany is one of the best, if not THE best, Atari subsidary. Atari has done things in Germany that most US Atarians have just been dreaming of ever since 1985: They have and still are heavely advertising their computers.

Since 1985 several TV commercials could be seen at prime time in the major TV stations for the ST. Radio commercials are constantly praising Atari computers and since the TT is selling here in Germany, several ads for it have been placed both in magazines and newspapers.

Let's hope that the spring of 1991 will see a new blossoming of Atari in North America with it's new line of Mega STEs and TTs. By the way - as reported two weeks ago, Atari held the press conference in Munich, Germany, on December 12th. Just as expected they showed off the Mega STE. It was said there, that a limited number of Mega STEs is already on its way to Germany. The first units are believed to arrive at dealers shelves shortly after Christmas. At first only one configuration of the Mega STE will be available in Germany. It will be the Mega STE 4 with a 48 MB harddrive. The official retail price for this unit will be DM 3.000 (approx. US$ 2000) including the SM124 monochrome monitor.

Z*NET NEW ZEALAND
==========
by Jon Clarke, Contributing Editor

SUPER PRE XMAS ADVERTISING
Atari-NZ has started its pre-christmans advertising campain with avengence. Television adverts promoting the $NZ999 Atari Discovery Pack. When asked why the Discovery Pack was being promoted, Mr. Alex Davidson said, "The reason for this is the low retail demand in the economy, making purchasers more concerned about value for money than the lastest technology. We believe that offering the STFM with the Discovery Pack at $NZ999 does indeed give buyers value for money-its an excellent computer at a very attractive price.

STACY NOW AVAILABLE
In a dealer release Atari-NZ have advised its retailers the long awaited Stacy portable ST is now shipping to New Zealand. The first shipment

will be in the stores for Christmas. With a RRP of $NZ6995 it comes with 4 megs of memory, 40 meg hard disk, and a power source, power adaptor.

ATARI-NZ HAS A GOOD YEAR
During the course of 1990 Atari-NZ has sold more units than the last 12 months to date. When asked if Atari-NZ was happy with the results, Mr. Alex Davidson replied, "In the current state of New Zealands economy we are more than happy with the result." When asked if Atari-NZ had a commitment to the New Zeland Atari users, Davidson said, "We certainly do and you will see this by the current advertising campain, and the great dealer pricing we are giving. Further to this I would like to state that we are over the moon with the response to the introduction of the STe and the other new products we released this year."

ATARI BBS GET NATIONWIDE NETWORK
A company in New Zeland offering a free noding service to System Operators of BBS's, now has three Atari BBS's noding from it. They are Harbour Board BBS in Wellington, STarlight Express in Auckland and also STaTus in Auckland. Users from all around the country are flocking to the new service. Increased activity has been seen by users of all computers as they now see what Atari BBS's have to offer. The three BBS systems mentioned all run different software from FoReM to Express to MichTron V3. To quote a comment from a promenant person from IBM at a recent All SYSOP function, "It looks like Atari has finally grown up". (We did not have the heart to tell him Atari ST's have been doing this for over five years now)

BELL VERSUS BBS SYSOPS
======================
Compiled by Jerry Cross
Text downloaded from GEnie ST Roundtable

GTE TAKES ON INDIANA SYSOPS
BBS operators in Indiana complain that GTE is forcing them to accept extra-cost business rates rather than the residential rates they have been paying. Derry Nelson, sysop of the 1149 BBS in Elkhart, Ind., says that the changes were a surprise. The worst part of the surprise seems to be the large jump in monthly rates. A typical BBS would find its monthly bill increased by almost 200 percent.

The new tariff appears to give GTE wide-ranging control over its customers. As an example, the company can limit the length of calls "when in [GTE's] judgement such action is necessary." GTE claims authority to change a BBS to business rates because the service is provided "for use [of] the general public." Additional information is available from the Utility Consumer Counselor at 317/232-2494. The 1149 BBS can be reached at 219/293-1149.

FROM: Mike Marotta
TO: Bbs Users MSG # 130, Apr-7-90 0:31am
SUBJECT: Why Business Rates

These excerpts are from MPSC documents. It is established in regulatory commission administrative law that the PROVIDER files a tariff. For instance, it is a principle of regulatory law that a tariff cannot be effective prior to its filing date. A tariff that allowed this would "jump out" at a regulator who read it. Generally, however, the regulators ACCEPT the filing of the carrier and leave it to competing carriers or clients to file a complaint.

Michigan Bell Telephone Company Tariff MPSC No. 7 was issued on November 21, 1966. Its age alone speaks volumes.

<quote> "Original Sheet 11.
GENERAL REGULATIONS - CLASSIFICATION AND USE OF TELEPHONE SERVICES

A. APPLICATION IS BUSINESS AND RESIDENCE RATES (Formerly Sheet 15)

1. The determination as to whether telephone service is Business or Residence is based on the character of the Use to be made of the service. Service is classified as business service where the use is primarily or substantially of a business, professional, institutional, or otherwise occupational nature. Where the business use, if any, is incidental and where the major use is of a social or domestic nature, service is classified as residence service if installed in a residence.

2. Business rates apply at the following locations, among others:

a. In offices, stores and factories, and in quarters occupied by clubs, lodges, fraternal societies, schools, colleges, libraries, hospitals and other business establishments.

b. In residence locations where the place of residence is in the immediate proximity to a place of business and it is evident that the telephone in the residence is or will be used for business purposes; and in the residence locations where an extension is located at a place where business rates would apply.

c. In the residence of a practicing physician, dentist, veterinary, surgeon or other medical practioner who has no service at business rates at another location.

d. In any residence location where there is substantial business use of the service and the customer has no service elsewhere at business rates.

B.1.a.(2). A customer engaged in furnishing services of a secretarial nature may not use Telephone Company facilities to receive messages for one party to be forwarded to another party, unless such forwarding is of a temporary or occasional nature." <end quote>

FROM: Mike Marotta
TO: All Bbs users MSG # 131, Apr-7-90 0:32am
SUBJECT: more on rates - 2

As a result of the "Variety and Spice BBS" incident of March 1990, the MPSC issued a statement. Excepts follow:

<quote>"FORM LETTER FOR COMPUTER BULLETIN BOARDS

If bulletin boards or access to bulletin boards is provided to calling parties at no charge other than that which may be associated with the telephone call, and are not provided in conjunction with a business, a profession, an institution or other occupation, then it would appear that the service should not be classified as a business. If, however, there is a charge associated with any level of access to the bulletin board, whether the charge is rendered to cover costs or produce a profit, then the service would be considered a business or classification as such. This would also apply if any of the previous conditions mentioned were not met." <END QUOTE>

FROM: Mike Marotta
TO: All Users MSG # 134, Apr-7-90 0:25am
SUBJECT: Michigan Bell and You

04/06/1990 This statement was specially prepared by Michigan Bell to explain to the bulletin board user community their position on the question of business rates. The statement was given to me at my request by Michigan Bell's district manager for state government.
-- Mike Marotta.

<quote>"Telephone Service Classifications

Recently the question has arisen whether Michigan Bell is attempting to charge commercial rates to all computer bulletin boards in the state. Michigan Bell has not instituted a "program" to impose a specific class of service on any group of customers, i.e., computer bulletin boards. In fact, the decision on which class of service is required for computer bulletin boards is no different than it is for any other service. In making the decision, Michigan Bell is required to comply with tariffs approved by the Michigan Public Service Commission, which cover the matter of appropriate classification of telephone service.

The applicable tariffs require Michigan Bell to classify service primarily in accordance with the use that is to be made of the service. The tariffs specify the conditions under which a service is classified, for rate purposes, as business or residence service. For example, service is classified as business where the use is primarily that of a business. In the case of computer bulletin boards, for instance, is there is a charge associated with any level of access to the board, or money is solicited in conjunction with the board, that is considered conducting a business within the meaning of Michigan Bell's tariffs. The service, therefore, would be classified as business and business rates would apply. On the other hand, service that is used primarly for domestic purposes is classified as residence service. Again, using the example of computer bulletin boards, if the board is not associated with a business and no charge is assessed or solicited for access to the board, then service may be classified as residence in accordance with the application tariffs." <quote>

STATE OF INDIANA
INDIANA UTILITY REGULATORY COMMISSION

IN THE MATTER OF THE COMPLAINT OF)
TEN INDIVIDUALS AGAINST GTE NORTH) CAUSE NO. 39005
INCORPORATED PERTINENT TO CERTAIN)
CHARGES FOR TELEPHONE SERVICE)
RENDERED BY GTE NORTH INCORPORATED)

BY THE COMMISSION:

James R. Monk, Chairman
Mark W. Cooper, Chief Administrative Law Judge

On June 4, 1990, Randy Wilson, Derald A. Nelson, Clamies J. Lambright, David A. Reynolds, Thomas Battler, Don Billey, Jeff Jacobs, Jean Ludwig, George Himebaugh, Jr., and Delmar Mineard, Jr. (Complainants") filed a complaint with the Commission pursuant to IC 8-1-2-54 against GTE North Incorporated ("Respondent"). By their complaint, the Complainants state that certain of the provisions of the Respondent's tariffs on file with this Commission are unjustly discriminatory and unreasonable to the Complainants" detriment.

Pursuant to notice duly published as required by law, a Prehearing Conference was held in this Cause on July 27, 1990 at 1:30 P.M., EST, in Room 908, State Office Building, Indianapolis, Indiana. At the Prehearing Conference, the parties informally agreed as to procedural and scheduling matters to be operative in this Cause. However, counsel for the Respondent indicated that it would be subsequently submitting a motion to dismiss herein and the Commission withheld the issuance of the Prehearing Conference Order pending the submission and ruling upon Respondent's Motion to Dismiss.

On August 10, 1990, the Respondent filed its Answer and Motion to Dismiss, which filing appears in the following words and figures, to-wit:

(H.I.)

Based upon the applicable law and the filings of the parties, the Commission now finds as follows:

1. Commission Jurisdiction. The Respondent is a "public utility" within the meaning of the Public Service Commission Act, as amended. IC 8-1-2-54 provides the complaints may be filed against public utilities with the Commission pertinent to the practices and acts of those utilities. The complaint initiating this Cause was filed under the provisions of IC 8-1-2-54 and appears to satisfy the requirements thereof. The Prehearing Conference was conducted pursuant to notice duly published as required by law. IC 8-1-2 et seq. and the Commission's Rules and Regulations of Practice provide the Commission with the authority to appropriatley adjudicate and dispose of cases pending before it. Therefore, the Commission has jurisdiction over the parties and subject matter herein.

2. Commission Discussion and Findings. The Complainants allege that certain provisions of Respondent's tariffs are unjustly discriminatory and unreasonable and the Complainants have been caused harm thereby. The Complainants state that they are customers of the Respondent and are engaged in the hobby of operating a Computer Bulletin Board System ("BBS"). The Complainants allege that pursuant to these tariff provisions the Respondent is billing them at a business rate rather that a residential rate whic is inappropriate and to their detriment. The Complainants contend that the operation of a BBS is a hobby and not a business venture. The Complainants also contend that applying a business rate to them consititutes a rate change which must be subjected to public hearing prior to the application thereof. Respondent points out that the tariff complained of by the Complainants was approved by the Commission on January 31, 1990 pursuant to IC 8-1-2-42. Respondent also points out there is no dispute between the parties as to whether this is the appropriate tariff under which the Complaintant's service should be provided. Complainant citees certain language set forth at Section 6.5 of the tariff which reads, as follows:

The Company shall determine if business or residence rates apply to a customer service.

Respondent goes on to set forth additional language from the tariif which set forth situations under which a business reate is properly applied. Respondent concludes that BBS clearly fits the categories set forth by the tariff under which a business rate applies

Respondent goes on to set forth additional language from the tariif which set forth situations under which a business reate is properly applied. Respondent concludes that BBS clearly fits the categories set forth by the tariff under which a business rate applies and the fact that Complainants allege that BBS is a hobby does not remove it from the categories as defined within the tariff.

Respondent's Motion to Dismis does not clearly set forth the authority or rule under which the Motion is brought. Therefore, we must first determine the precise character of the Motion that we may know the criteria under which its propriety is to be considered. Although Respondent's filing is denominated as a "Motion to Dismiss", a review of that Motion reveals that it does not clearly fall within the parameters of the familiar request for involuntary dimissal under T.R. 41 or matters properly raised under T.R. 12 (B). It appears that Respondent's filing is most akin to a Motion for Judgement on the Pleadings as provided by T.R. 12(C) or a Motion for Summary Judgement pursuant to t.R. 56. In any event, a review of T.R. 12(C) directs that a motion brought under that rule in circumstances such as these should be treated as one for summary judgement and be disposed of as provided by T.R. 56. T.R. 56(C) sets forth the standard under which a moving party may prevail on motion for summary judgement. The Rule provides that the judgement sought shall be rendered if there is no genuine issue as to any material fact and that the moving party is entitled to a judgement as a matter of law. This standard appears to be applicable in this

situation. A review of the Complaint and Respondent's filing indicates that the parties agree upn the operative facts and that there exist no genuine dispute as to any material fact. The question remaining to the Commission is no then fact sensitive but whether Respondent's tariif provisions which allows the Respondent to bill the Complainants under a business rate constitutes the improper charging of a reate without prior Commission approval and/or whether that tariff provision is unjust and discriminatory. Both of which are conclusions of law for the Commission as contemplated by T.R. 56 (C).

The Complainants allege that the Respondent's application of a business rate to the Complainants constitutes a rate change for which prior Commission approval must be obtained after holding a public hearing. The cleand and unambiguous terminology of Respondent's tarriff which was approved by this Commission allows the Respondent to determine wheter a particular service is appropriatley billed under a residence rate or a business rate. Clearly the tariff approved by the Commission authorizes the appropriate rate. The Complainants have not alleged that Respondent acted in a fashion inconsistent with the tariff. Therefore, when information comes to the Respondent that leads it to believe that a particular customer's situation has changed it is authorized under the tariff to impose a rate change consistent with the terms of the tariff. The Respondent's review of circumstances and decision to impose a different rate authorized under the tariff clearly does not constitute a rate change as contemplated by IC 8-1-2-42. Therefore, considering the undisputed facts the Complainants would not be entitled to prevail on this issue.

The Complainants next allege, without specifically stating the reasons therefor, that Respondents tariff in question is unreasonably discriminatory. This Commission has for many decades been charged with the duty to review utility tariffs under the mandate that utility services should not be discriminator and must serve puble interest. A review of the official files of the Commission disclosed the provisions of Respondent's tariff in question are of a standard type and kind for local exchange telephone service. Further, we note that such tariff provisons were reviewed by the Commission's Engineering Division which was properly delegated with the authority to consider the propriety of that tariff and make ultimate approval or rejection thereof. Base upon a review of Respondent's tariff, we find that the tariff provisions are not unreasonable and discriminatory either as written or by their application. Therefore, we find that the Complainants are not entitled to prevail upon this issue as a matter of law.

Based on forgoing, we find that Summary Judgement should be granted in favor of the Respondent and the Complaintants request to investigate the acts, practices and rates of the Respondent and for the holding of public hearing on the matter of the imposition of a business rate to the Complainants should be DENIED.

IT IS THEREFORE ORDERED BY THE INDIANA UTILITY REGULATORY COMMISSION THAT:

1. The Respondent shall be deemed to have prevailed on the matters at issue herein and that Complaintants request for an investigation into the acts, practices and rates of the Respondent and the holding of public hearing upon the Respondent's imposition of a business rate upon the Complainants shall be, and hereby DENIED.

2. This Order shall be effective on and after the date of its approval.

NOV 21, 1990

WHERE DOES IT GO FROM HERE?

On January 29th and 31st, a hearing will be held before an administrative law judge concerning the case of the Variety & Spice BBS (Gross Point, MI) and Michigan Bell. In March, Michigan Bell informed the sysop that they would begin charging him business rates for his phone lines because they determined that his charging for access does not qualify him for residencial rates.

Several cases of this nature have, or are currently being faught around the country. These files are being circulated to inform those who use or run BBS's of pending legislation in Michigan and Indiana.

For more information, or if you would like to testify before the MPSC on the above date, please contact one of the following sources.

Thanks for your support!

BBS EXPRESS! ST UPDATE
==========

/\
/ / 2 Presenting BBS Express! ST v1.41
/ \ Copyright (c) 1987,1990
/\/\ \ Ltd. by T2 Ltd.
\/\ \/
\/ (Formerly an ICD Inc. product)

T2 Ltd BBS Express! Support 714-357-6806 (PC Pursuit "CACOL" node)

December 24, 1990

If you are upgrading from version 1.30, you'll need to update your file DESCRIPTION format with a utility called CNVTDESC.PRG that is online at the support boards. It is recommended that you direct the program to write out your descriptions to a temporary folder, so as not to write over your existing descriptions should a problem occur. The program is very simple to use, just follow the prompts.

What's New In v1.41?

NEW Six new '&' variables have been added! Five of these are prompting variables (which you can use to control paging of files, etc.) and the sixth displays whether the SysOp is in or out, depending on the status of your F5 key.

NEW Color in the message bases! If you or your users are in VT52 Color mode, you may now enter control commands to bring color and inverse into your messages. VT52 Mono users will be able to enter and see inverse text. ASCII users will see the messages normally.

NEW Another setting has been added to the [P]arameters menu. A user may now set his high message number, and it can be saved or used on that session only. This can enable users who haven't been online in a long time to instantly bring their message pointers up to date so that they don't have to go through a lot of messages on a QuickScan. Or if a user has a need to restore an old setting, now he can do so.

NEW During a message read function, you can now (ta da) [M]ove messages! Simply press 'M' when you see a message that you would like to move and the BBS will prompt you <M>ove Or <C>opy? Select the desired action and the BBS does the rest. You can move/copy messages from Email or any base to any other _valid_ message base. A lengthy message will be truncated to fit into a base which is predefined as having a shorter length than that of the message being moved.

NEW [M]oving messages is great, but how about files? You guessed it, you can now move files from the [B]rowse mode! But that is just part of the story -- in fact, [M]ove files is part of a sub-menu called...

NEW [F]ile Utilities! During browse mode in the file areas, a Sysop may press 'F' and bring up a sub-menu which looks like this:

[C]opy File And Description
[M]ove File And Description
[S]pace Left On Drive 'x'
[T]ouch Time/Datestamp

Command (Or [Return]):

So while browsing you can automate your maintenance duties instead of going into SysOp mode and typing MS-DOS style commands. The first two commands allow you to enter a SIG number for destination or view your list of file areas. Note that the time/datestamp is updated when moving /copying files, as in the SysOp Shell. [S]pace simply shows you free

space on a drive (which you will be prompted for), and touch just updates the files time/datestamp, which makes the file appear as new to your callers.

NEW The READSUB.HLP menu has a new entry: 'O'ptions. This will allow a user to set his parameters (such as translation, continuous scroll and clear screen ON/OFF) during a message scan function. Think about the advantage of being able to turn on continuous scroll mode while in a QuickScan on a busy long distance board...

NEW The main command prompt now displays the actual time remaining for the user online. This takes into account the users time on previously for that day, and shows the actual logical time allowed for that call. The status lines on the SysOp screen also display the same way now.

NEW Along the same lines as above, the '&' variable &33 now properly returns the logical time left per call as it should. For the last three years it has been returning the same value as &13, so was fairly useless. Now it may come in handy!

NEW The call log will now show you what protocol was used for each ul/dl a user made.

NEW A couple of minor things: The Idle Timeout has been cleaned up some, and the ability to search for a string when selecting someone to send mail to has been made optional.

NEW Two more minor things: When changing SIGs, the BBS hotkeys any two-digit number (ie, it isn't necessary to press [Return] if entering file area 10 and above, but it is when entering a 0-9.) The pad last block option is gone (and has been for a while now) since it is outdated and confusing to most.

NEW [P]arameter updates: A user may no longer change his real name via the parameter menu. It is not needed, since when logging on as new, they have the option to change any information then. After that, why should anyone need to change their real name? Also the menu option that allows the user to change his protocol has been updated so that the current protocol is displayed when listing parms (so you don't have to select it to view your current setting).

KIDS-91 PROJECT
==========
Compiled by Jon Clarke

Date: Mon, 24 Dec 1990 15:01:26 +0100
X-To: GOLLUM::"stt@kcbbs.gen.nz"
Subject: The KIDS-91 discussion list
To: stt@kcbbs.gen.nz

Dear friend of the KIDS-91 project,

We have set up a Listserv discussion group called "KIDS-91" to serve our global project. It's meant to be a central meeting place for ALL

interested persons. This is where we can

* post announcements of local KIDS-91 activities.
* exchange experiences, ideas and information.
* upload student's responses.

TO SUBSCRIBE
You can subscribe to KIDS-91 by sending mail to listserv@vm1.nodak.edu
(or LISTSERV@NDSUVM1 on BITNET) with the BODY or TEXT of the mail
containing the command

SUB KIDS-91 yourfirstname yourlastname
For example:
SUB KIDS-91 Chen Wei

Please be sure to send the command to LISTSERV and NOT to the list.
Also note that the command should be in the body of the mail (in other
words after the blank line following the headers) and not in the
subject.

The LISTSERV will receive a message which would look like this:

Date: ...
From: someuser@somehost
To: listserv@vm1.nodak.edu

SUB KIDS-91 Chen Wei

and you will automatically become a member.

See you there,
Odd de Presno
KIDS-91 Project Director

Date: Mon, 24 Dec 1990 15:00:58 +0100

The KIDS-91 Newsletter
A Global Dialog for Children 10-15 Years
****
Issue number 4, October 26 1990.

IN THIS ISSUE
1. The KIDS-91 project
2. The Newsletter
3. Progress report
4. How teachers can participate in KIDS-91
5. For more information about KIDS-91.

1. KIDS-91
The aim is to get as many children in the age group 10 -15 as possible
involved in a GLOBAL dialog continuing until May 12th 1991. We would

like their responses to these questions:

1) Who am I?
2) What do I want to be when I grow up?
3) How do I want the world to be better when I grow up?
4) What can I do now to make this happen?

We would also like the children to illustrate their future vision, for example in a drawing, a video tape, or something else.

On May 12th, 1991, the children will be invited to "chat" with each other in a global electronic dialog. Exhibitions of selected parts of the responses will be shipped back to the children of the world for them to see and enjoy.

2. THE NEWSLETTER
is an information bulletin for participants, sponsors, teachers, mediators, promoters, and other interested persons.

Suggestions and contributions to the next issue are more than welcome. We hope to port it within 45 days or so. Write the Editor to receive future issues of the newsletter.

Editor: Odd de Presno, Saltrod, Norway.
Online addresses:
Internet: opresno@coma.uio.no
UUCP/EUnet: uunet!coma.uio.no!opresno
S.H.S. BBS: SYSOP (Phone: +47 41 31378)

3. PROGRESS REPORT
KIDS-91 is now available through Internet/BITNET through the list KIDS-91@VM1.NODAK.EDU and KIDCAFE@VM1.NODAK.EDU (see under "Level 3: Online - Participative" below". Here are some recent responses in the data base:

Question #1: Who Am I?
I am Arvind Howarth. I am an eleven-year-old girl. I love dolphins and hate the killing of them (pollution, tuna nets etc). I like drawing, reading, swimming and basic outdoor sport. I hope that someone will save the world, and stop the wars. Wars and the thought of them scare me. (from London, England)

My name is Lucy and I am 15 years old. I enjoy acting, reading and playing the saxaphone. I am concerned with the welfare of our planet. I find myself feeling very exasperated when my careers teacher asks the class what we want to become when we grow up! As if we actually have a choice! The way the planet is going, there is only one thing left to work towards, and thats saving ours and many other creatures world! (from Australia)

Question #2: What Do I Want To Be When I Grow Up?
I would like to go to art school and become an artist. I'm not that bothered about money, but I would love to have a job that I enjoy and

that I look forward to. (Arvind)

I find myself feeling very exasperated when my careers teacher asks the class what we want to become when we grow up! As if we actually have a choice! The way the planet is going, there is only one thing left to work towards, and thats saving ours and many other creatures world! As you may have guessed, I am of the opinion that there is only one thing to grow up for! Our planet! So I intend to become an activest (hopefully in theatre). (Lucy)

Question #3: How Do I Want The World To Be Better When I Grow Up?
I think everyone should ride a bicycle. No pollution, no petrol, and you get fit. I also think there should be no wars. Why don't the prime ministers battle it out themselves? Instead of killing the rest of the world. But it would be better if no-one had to improve anything. If everything was satisfactory without modernising. But that's too idealistic I suppose. (Arvind)

By the time I am an adult, I would like the world to be like one big peaceful commune, with no seperate countries, no need or abuse of anything and a loving bond between all things. I think this may take a little time, so maybe our children will experience such peace! (Lucy)

Question #4: What Can I Do Now To Make This Happen?
I honestly don't think I can do anything (on my own). If everyone did the right thing - recycling, composting, demonstrating and basically living contentedly - then there would be no problem. But on my own I can't help the world. So I'll do my bit and hope everyone does their's. (Arvind)

If this dream is to become reality, we will have to begin now by treating each other with love and care, and then all things around us! Peace can only be achieved by each person taking the initiative! For my part, I am in the process of starting an action group in the Byron Bay for young caring people. (Lucy)

4. How teachers can participate in KIDS-91
We assume that a copy of the KIDS-91 "Letter to Teachers" and the other material is available. If not, please ask for copies. The guidelines below is just meant to give additional details about how teachers can participate.

Here are the different ways you can choose to participate in KIDS-91 with your class:

Level 1: Ordinary Mail!
Level 2: One-Way Electronic Mail
Level 3: Online - Participative
Level 4: Online - Full Interactive Communications
Level 5: Online - Interactive and Planning.

These different levels of teacher involvement have the following meaning:

Level 1: Ordinary Mail!
Have the students respond to the four questions.

Responses to question 1:
Each response should contain the child's name, age and city/place (as the last phrase of the response).

Responses to question number 2-4:
After each child's responses, add his or her name. Like this:
(Alberto Blanco).

Save the responses on computer diskettes (MS-DOS 5.25" or 3.5" or Macintosh) as an ordinary DOS or ASCII text file (text written with Word Perfect is also acceptable). Write the text with left margin 0 and right margin 60.

You may want to let the students enter it themselves as part of the exercise. - If the school does not have computer equipment, perhaps the class could use one owned by a parent or local business for this project.

Sort the student's responses by question, e.g. first all the responses to question number 1, then all responses to question number 2, etc.

On the top of the file, write the teacher(s) names, the class name, the school name and mailing address. Add the electronic address, if any. (Don't forget this, if you want the school to be added to the mailing list for the final exhibition.)

Note: We strongly urge you to send us the responses in electronic form (on diskette). This is the only way that we can be sure to enter the student's names correctly. Also, in this way only can we guarantee that their responses will end up in the global data base. We may be able to input hand-written responses, but can give no guarantees.

Mail the diskette(s) to:
KIDS-91, c/o SciNet, 131 Bloor Street West, Suite 200,
Box 326, Toronto, Ontario, M5S 1R8, Canada.

The next step is to let the students make the drawings/paintings. Remember to have the students write their name, age and place/school CLEARLY on the front page. If the contribution is selected to be exhibited, then the audience should be able to see the name of the artist.

Challenge them to find more creative ways of 'drawing themselves as adults in their desired future world'. Ref. the "Letter to Teachers" for ideas. Tell them that there is a competition going on with prizes for the most innovative creators.

Mail the Creative Contributions to:
KIDS-91, c/o Odd de Presno, 4815 Saltrod, Norway.

We will add your school to our mailing list for the final exhibition, that we plan to send back to the world after the conclusion of the

project's phase 1.

Level 2: Online - One-Way Electronic Mail
Prepare responses to the four questions as above. Here we'll only
comment on the differences.

Send the responses as electronic mail to the following electronic
address:

jonno@scinet.UUCP (if it fails, try: opresno@coma.uio.no)

Here are some backup solutions:
* upload the file to my BBS at +47 41 31378
* if your network is connected to DASnet, send to [DEZNDP]opresno
* send a fax to Odd de Presno at +47 41 27111 and ask how to send it.

Remember: tell what electronic mailbox(es) that you are currently using.

Level 3: Online - Participative
Locate a suitable, participating networking system, and access the
'local' KIDS-91 area. Here are some alternatives:

* SciNet in Canada and USA (upload to items 11-14 in the "KIDS-91" con).
* Internet/BITNET etc. Upload to KIDS-91@vm1.NoDak.EDU

Join this LISTSERV by sending the command SUB KIDS-91 yourname to
LISTSERV@vm1.NoDak.EDU (for example: SUB KIDS-91 Ole Olsen). The
command should be in the BODY of the text. Keep the subject blank.

Another list called KIDCAFE is established for dialog between
participating children (SUB KIDCAFE yourname).

* TWICS (Tokyo): use the "KIDS91" conference in PARTIcipate.
* Compuserve: upload to library 10 in the Education Forum.

If you want the children to upload their responses personally, use
library 0 (or messages sent to section 0) in the Student's Forum.
Children acting on their own should upload their responses to library 15
of the IBM Special Needs Forum. You can also use section 1 (Getting
Started) of the HamNet Forum for interactive participation.

* The "KIDS.91" conference on Pegasus (Australia),
* The "KIDS-91" folder under "Classroom Projects" in the AGE folder on
AppleLink.
* The "KIDS91" conference on IRIS.
* The "KIDS91" topic on MetaNet (in Salon).
* GreenNet (England),
* The "KIDS.91" conference on The Web (Canada).
* The "KIDS.91" conference on FredsNaetet (Sweden)
* The "KIDS.91" conference on PeaceNet/EcoNet (US)
* The "KIDS91" conference on SHS BBS in Norway (Phone: +47 41 31378)
* The KIDS-91 area on Merlin BBS (Maryland, USA).

Download other childrens' responses and use them in your classes. You may want your students to upload their responses individual.

Level 4: Online - Full Interactive and Communications
Read and respond to all KIDS-91 topics online. Read and enter responses to the four questions directly. Send private electronic mail to other participants - form 'keypals' relationships with new friends.

Let the students participate in regular online 'chats' with other children. For example, through KIDCAFE with Krystal on SciNet or Kid to Kid in IBMSPECIAL forum on CompuServe. Encourage them to explore the world with new tools.

Regularly download and print out new responses from the global data base on SciNet. Use the information in geography, environmental studies, history, etc.

Encourage and prepare the students to participate in the global electronic "chat" that will take place on May 12, 1991.

Level 5: Online - Interactive and Planning
Access SciNet in Canada (from anywhere), ask to be a member of KIDPLAN, and join the KIDS-91 staff of volunteers to help pull this here thing off.

Send e-mail to jonno@scinet.UUCP about how to get access to SciNet and KIDPLAN.

5. FOR INFORMATION
about KIDS-91 or if you want to help out or participate, contact the editor or one of the following persons:

Nancy Stefanik: MetaNet=stefanik, PeaceNet=nstefanik, AppleLink=x0447, TCN=tcn145
Jonn Ord/SciNet: jonno@scinet.UUCP

You can also write to:

KIDS-91, c/o SciNet, 131 Bloor Street West, Suite 200,
Box 326, Toronto, Ontario, M5S 1R8, Canada

OPERATION DESERT SHIELD
==========

ATARI COMPUTER DONATES PORTABLE
COLOR VIDEO GAME SYSTEMS TO OPERATION DESERT SHIELD

SUNNYVALE, CA (November 30, 1990) -- To give military personnel participating in Operation Desert Shield a healthy way to release pent-up energy and to alleviate some of their boredom, Atari Corporation has made arrangements with the Defense Logistics Agency (DLA) and the USO to supply Lynx portable color video game system kiosks and video game cartridges to military recreation centers in Saudi Arabia.

The display kiosks that are being shipped have four Lynx systems installed as well as complete libraries of game cards. "We've packed

the Lynx kiosks so they can be taken right from the palettes, plugged in and used by the men and women who are temporarily stationed in Saudi Arabia," said Meade Ames-Klein, president of the consumer products game division. "We're confident that the game systems will be in the recreation centers before the Christmas holidays."

Requests from the Field

Ames-Klein said that the idea of shipping Lynx systems to Operation Desert Shield was discussed shortly after the first group of troops arrived in Saudi Arabia. "Our military personnel hadn't been there a month when we received a letter from an Army sergeant requesting that we ship him a sun visor/screen guard for his Lynx so he could play his system more easily when he was off duty," Ames-Klein recalled.

"Since then," he noted, "we've received dozens of letters from military personnel who have told us about endless hours of having nothing to do. They've requested accessories such as sun visors, carrying pouches and additional game cartridges. Others, have seen someone else stationed there with a Lynx and have wanted to buy their own system and games."

"When it became obvious that our troops were going to be in the Middle East for some time," he continued, "we thought the Lynx systems and game cartridges would help improve morale and would provide the men and women stationed there with a little entertainment. Perhaps, for at least a short period of time, the Lynx will let them escape from the reality of their surroundings."

Variety of Game Cartridges

Ames-Klein said that with the exception of "Blue Lighting," a combat jet fighter game, the games are not war-oriented and have been designed to test an individual's skills and agility. With a number of the game cards, players in the recreation centers will be able to connect the Lynx game systems with ComLynx cables and enjoy multi-player competition.

Game cards that are being shipped with the Kiosks include "California Games," a one- or two-player game that includes BMX biking, skateboarding, surfing and foot bag juggling; "Gates of Zendocon," a 30-level game where players conquer hostile aliens in order to return home; and "Electrocop," where the player must rescue the President's daughter. Games also include "Chip's Challenge," with 144 puzzles; "Gauntlet," where up to four players can search for the Star Gem; "Slime World" where up to eight players travel deep into the gooiest, most slippery mire in the world; "Klax,"which challenges players to stack tiles and create a klax; "Paperboy;" "Ms. PackMan" and others.

Second-Generation Players

Ames-Klein pointed out that many of the men and women stationed in Saudi Arabia are second-generation video game players ... they grew up playing Atari's early game systems and have returned to playing the new

advanced games. "Back in 1984/85, they lost interest in video games because the software was boring," he noted. "But the new generation of video games feature dynamite graphics and color, as well as exceptional complexity and depth of play. Today's games are much more difficult to master because the game developers have taken maximum advantage of the advanced microprocessor used in the Lynx system."

Ames-Klein valued the initial shipment of Lynx video game kiosks and game cartridges at $50,000. He added that, depending upon how long U.S. military are stationed in the area and the feedback they receive from USO officials, additional Lynx systems may be sent to the area.

First Color Portable System

Lynx, which was introduced in several test markets for Christmas last year was the video game industry's first color hand-held video entertainment system. Slightly larger than a video cassette, the system features a backlit LCD screen that displays up to 16 colors from a palette of 4,096. The Lynx screen can be rotated 180 degrees for right- or left-handed play. Powered by six "AA" batteries, the system uses credit card-sized game cartridges so players can enjoy any of the more than 15 games that are currently available.

Priced at $179.95, the Lynx portable color entertainment system, accessories and game cartridges are available at major retailers across the country.

For complete information on Lynx, Atari's home video game systems and growing family of video game software call or write Ron Beltramo, Vice President of Marketing, Atari Computer, 1196 Borregas Avenue, Sunnyvale, CA 94088, (408) 745-2000, FAX (408) 745-2088.

What do you mean about missile command and track balls?
Is there a secret command to make itwork better with one?
Ive got the track ball, and would be interested in this.

3551. Re: BASIC programming

Newsgroup: comp.sys.atari.8bit
Date: 1991-01-09 17:20:38 UTC
From: techno@lime.in-berlin.de
Message-ID: <X02MRVE@lime.in-berlin.de>
Source record: 114504

ebm@zinn.MV.COM (Eric Mallett) writes:

>I've lost my manual for programming in BASIC on the Atari 800XL, and I
>was wondering if someone could tell me how to make sounds on this
>computer in BASIC. The BASIC language comes already in the computer.

The command used is SOUND.

Syntax:

SOUND <voice>,<pitch>,<distortion>,<volume>

Ranges:

voice: 0-3
pitch: 0-255
distortion: 0-15
volume: 0-15

Example:

```
10 FOR I=0 TO 255
20 SOUND 1,I,10,12 : REM pure tone using voice #1
30 NEXT I
40 SOUND 1,0,0,0 : REM turn off voice #1, NOTE: only volume must be set to 0
50 END
```

Hope this helps,

Techno

3552. Atari 800/XL/XE benchmarks

Newsgroup: comp.sys.atari.8bit
Date: 1991-01-10 00:16:35 UTC
From: darekm@microsoft.UUCP
Message-ID: <60383@microsoft.UUCP>
Source record: 114506

This may seem like a silly request, but I need some benchmarks for various 8-bit computers. For example, the Atari 800, the 800XL, the 130XE, with Atari BASIC, with various processors (6502, 65816, etc).

For each benchmark, please use regular Atari BASIC. Please indicate which revision of the operating system you are using (A through D), which version of Atari BASIC (A through C), whether you are using the FASTCHIP floating point chip or maybe a RAM based operating system (Translator disk, etc), and whether you are running the standard 6502 or the Turbo 816 upgrade.

Also, type in NEW before running each program. Run each program in GR.0. Do not use Basic XL or Basic XE.

When timing these programs, please use a watch with accuracy to at least one second, and time from the time you press Return to the time you see the READY prompt again.

Program #1:

```
10 FOR X = 1 TO 10000
20 ?X,SQR(X)
30 NEXT X
```

Program #2:

```
10 FOR X = 1 TO 10000:NEXT X
```

Program #3:

```
10 S = PEEK(88)+PEEK(89)*256
20 FOR X = 0 TO 959
30 POKE S+X,X/4
40 NEXT X
50 GR.0
```

Program #4:

```
10 GR.8+16
20 CO.1
30 FOR X = 0 TO 319
40 PLOT X,0
50 DRAWTO 319,191
60 NEXT X
70 GR.0
```

Please send replies to by email, or better yet, reply to me on my Compuserve account (73657,2714) or my GEnie account (BRASOFT).

WELL, A new 2600 costs just $30 and even less in some places.
Why bother to repair it.
why would you want to anyways?
Colecovision (a step up from that but by no means a nintendo) had an
atari 2600 external adaptor and im sure that you could get one for about
the same price or thereabouts.

Theres at least one C compiler availabe through The Atari Archive.
I believe its cc65, along with other programs for it.

DBC was slow & generated pseudo-code. CC8/Ace C was faster & generated pseudo-code. CC65 is fast and generates real 6502 assembly. Get CC65. It should be available from the FTP archive @ atari.archive.umich.edu.

From: whitcomb@aurs01.uucp
Message-ID: <59428@aurs01.UUCP>
Source record: 114513

I have been browsing this group for a while, and I'm starting to get interested in an 8-bit machine for games. I currently have a Mega ST2 that I use for MIDI and applications, but I know next to nothing about 8-bit machines. I have read about an 8-bit emulator for the ST, but I don't have much information about it. So...

1. Is the Xformer emulator a satisfactory replacement for a real 800? If so, what sort of hardware do I need to read 8-bit disks? Can the emulator read 8-bit cartridges via the ST cartidge port? Is there a list of games that will run on it?

2. If the Xformer is not satisfactory, what is the minimum (read "cheapest") 8-bit configuration suitable for game playing? Does it have a built-in disk drive? Can I use my ST color monitor or my TV with it?

Please excuse my 8-bit ignorance, but there doesn't seem to be much information around here.

Thanks,

Jonathan

On Missile Command, you can type Ctrl-T immed. after startup to switch
into Trak-Ball mode. It really grooves with a trak-ball! Unfortunately,
I think MC is the only game that really utilized the trak-ball's abilities--
no other game I have offers the same result.

Maybe it's Shift-T or something else with a T; it's been awhile.
Hope this works for you...

3562. WANTED: Source for replacement drive mech

Newsgroup: comp.sys.atari.8bit
Date: 1991-01-13 15:13:29 UTC
From: kentd@FtCollins.NCR.com
Message-ID: <KENTD.91Jan13151329@zappa.FtCollins.NCR.com>
Source record: 114520

The drive mech of my old Percom AT-88 (SS/SD) is hosed and I need a
replacement for it. The drive mech looks like a 'standard' IBM 5 1/4
floppy with the 4pin power supply interface and 34 pin edge connector.
It says Tandon TM1000-1A on it.

So, my question is, where can I get a replacement for this unit? Does
anyone still sell SS/SD drive mechs? And will any IBM type SS/SD do?

Does anyone know if I could just use a 5 1/4 Double Density drive with
instead? They're easy to find and pretty cheap anyway...

Any help/info would be appreciated.

You can also use the ST mouse as well as a trak ball for Missle Command. I
don't of any other games that use the trak ball mode either. Millipede works
surprisingly well though in the joystick mode of the trak ball..

I doubt you'll be able to find a SSSD drive mech, but any standard IBM
drive should work. Of course, you'll still only get single density unless
the trak was made to use double density drives.
Go ahead and try it and let the net know how it works out.

3568. Need information on Atari 5200 game

Newsgroup: comp.sys.atari.8bit
Date: 1991-01-20 02:19:47 UTC
From: dpalermo@aludra.usc.edu
Message-ID: <14255@chaph.usc.edu>
Source record: 114522

Hello,

I have picked up a surplus 5200 to use the motherboard as an example
to an introduction to computer hardware course for art students. Anyway,
I was wondering if someone could help me identify the four largest chips
on the board. They are all 40 pin chips and we would like to be able
to point out the CPU, MMU(?), etc. The chips are:

OKI (Atari) C012294-22 M3981
Rockwell C014806-12 8302
AMI C014805-1 8308MDL C03069
AMI C012296D-01 8249MBQ C04473

Any other details anyone may have of the layout of the board would
also be appreciated (amount of RAM, clock speed, etc).

Thanks for your help,
Dan Palermo
dpalermo@usc.edu

> AMI C014805-1 8308MDL C03069
> AMI C012296D-01 8249MBQ C04473

CO12294 is a custom Atari chip nicknamed POKEY. It stands for POt/KEYboard.
It is used for I/O, sounds, paddle inputs, and internal timing.

CO14806 is a slightly modified 6502 microprocessor. Atari added some circuitry
internally to cut down on the parts count to syncronize operation with the
custom graphics chip. This had the nickname CPU SALLY.

CO14805 is the GTIA chip used for graphics. It stands for Graphic Television
Interface Adapter. Its primary task is to generate color and luminance signals
from the ANTIC display processor. It also monitors the joystick trigger
buttons.

CO12296 is the ANTIC chip which is the display processor. It stands for
Alphanumeric Television Interface Controller. It is a custom display
microprocessor with an instruction set customized for graphics generation.
It also has the ability to control the address and data bus and RAM refresh.

Lately, I have been trying to get CC65 and it's related stuff for my
old 800. I ftp'd (binary mode) to an ATT 386 unix workstation, and used
it's simul-task system with the util utility (writes an atari DD disk from
an IBM compatible system), and brought it home happily (I used the /b(inary))
switch on util... None of the execs I have gotten will run, is there some
translation going on somewhere that I have missed, or are other people finding
that the com files don't work. I tried it with dos xl 2.35I, mydos 4.2c, and
atari dos 2.5, and none of them work. Just wondering if anyone has had similar
problems. I unarced cc65 arc on an IBM, but supunarc.com, which I got via
the same path did not work either. Hmmmmm....Anyone have a suggestion?

Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit

Remember those old Atari CX85 numeric keypads? Some electronics
company had those selling for about $7 a pad some time ago ...
but I suddenly need one now! Does anyone know what happened to
all the CX85 keypads? Does anyone have a used keypad for sale?

Please mail replies and I'll summarize. Honest.

Yeah, that Util file doesn't write binary files that well. I've
looked at the source code, but not knowing C that well, couldn't see the
problem. Your best bet would be to write the ARC file to the Atari DD disk--
if something's wrong with the file, you'll get a CRC error from the DeArcer
on the 8-bit, but in my experience, ARC files transfer over pretty well.
It occurs to me, in fact, that my own copy of supunarc.com was
transferred from my AT clone to my 130XE via modem-- the fault, after all,
is with util. So, if you have access to a modem for your 8-bit, that might be
the best way of getting supunarc.com over. (Or, you could transfer everything
over via modem or null modem, but that would defeat the purpose of util,
wouldn't it :)) Stick to util for text or stuff that the non-Atari can
recognize, like ARC.

Yep, the 5200 is almost exactly the same as an XL. In fact, most cartridges
for the 5200 can run on an XL/XE machine (or even a 400 or 800, if there
are no funny OS calls) with little or no modification if you have them in a
proper format. (I've never seen a 5200 cartridge, so I don't know if they're
the same size, but I've seen various binary files that were transferred over
by pirates and/or people who wanted to continue to play their favorite games
once their 5200 broke down, so I assume it can't be that much of a feat.)

3578. Trouble with old disks...

Newsgroup: comp.sys.atari.8bit
Date: 1991-01-24 01:26:15 UTC
From: yoshida@eniac.seas.upenn.edu
Message-ID: <36189@netnews.upenn.edu>
Source record: 114529

Recently I've been attempting to backup some of my atari disks (some
of which were originally written to in the early 80's). On some of the
disks I've been getting sector read errors (I was using Copymate sector
copier from ANTIC) that generate a "G4" error on my Indus GT drive.
It seems that the drive tries to read the sector several times, but
only sometimes can it eventually read the information (ie, it's NOT a
bad sector).
Does anyone know of a utility that will allow me to specify a certain
sector to be continually looked at until the information is successfully
read? Will cleaning my drive read/write head help?

--dan

BTW - The disks are regular DOS 2 formatted disks with binary files
on them (in case someone thought that the errors were from
the drive encountering tricky copy-protection).

Atari Computer System for sale

All of this stuff is availiable to the best offer.
I am willing to sell pieces of the system, but would much rather sell
the system as a whole.
All equipment will be sold "as is" although everything except for the
things listed as inoperative worked the last time that I used them.
Keep in mind that all the equipment will fill up a normal sized trunk
and most of your back seat if you wish to pick it up.

Pickup will be at Neoga, IL (between Mattoon and Effingham, IL on
Interstate 57; also about 70-80 miles south of Champaign, IL).
Otherwise I'll ship it to you (you pay for shipping).

Contact:

Todd Walk
RR 1 BOX 386
Neoga, IL 62447
217-895-3286 (best after 8pm)
walk@mrcnext.cso.uiuc.edu

Note on email: I don't check my email very often anymore, so you may have
to wait a few days for replies (but I prefer email).

(Note: you sent me messages before, if you are still interrested, please
email me again. My mailer died, killing the addresses I had saved.)

SmartDOS 6.1 (and higher) has a nifty function that you can reset the retry times to read a sector. If you think 9 times could do it, then see if you can get yourself a copy. SmartDOS will work in SD and DD. I thought I heard a rumor of a version working in HD, but never saw it.

3583. Keypad

Newsgroup: comp.sys.atari.8bit
Date: 1991-01-25 03:05:08 UTC
From: asgardia@unixland.uucp
Message-ID: <0q8aw2w163w@unixland.uucp>
Source record: 114538

Ive got a keypad here that I dont use.
I dont use it because I was given this pad without the bookkeeper software..

Id love to get ahold of the software for the bookkeeper..

someone posted here that they wanted to buy this thing..
Its silly to want to buy a used one because they are sold for $19.99 in ads.

To mail something like that it would cost a few bux and then theres a cost of paying the owner the $10 or so that a used one goes for.

its best to go for a new one.

Plus with that 19.99 you get 4 disks...

3584. How can I keep Kermit65 from losing Chars?

One possible solution that may or may not work is pressing the Atari Inverse key on and off I believe that this starts and stops flow control.

Try turning on flow control; that should do it. It seems that the
Kermit-65 screen handler is too slow (especially at scrolling) to handle
even 2400 bps. I have seen proposed improvements on the scrolling
algorithm which I imagine would speed things up a bit, but I doubt
that it could ever handle a steady stream at 9600 bps. An increase in
input buffer size would help most cases, though.

I'll bet that you could make a screen scrolling algorithm that keeps up at 9600 bps by using a custom display list, with every line of text mapped to a different location in memory. Then, to scroll the screen up a line, you merely rewrite the pointers in the display list instead of copying data. The memory holding the line which scrolled off the top of the screen is then used to hold the next line of text at the bottom of the screen.

Michael,

This isn't an Atari-related message, but I noticed you work for SGI...

I work for a company which sells turnkey Digital Image Recorder systems, based on the DEC MicroVAX computer. Some of the systems we've placed in the field are configured to connect, via Ethernet, to SGI-based turnkey graphics workstations, and we've had some incompatibility problems. Evidence suggests it may be a TCP/IP "tuning" problem, either on the VAX or on the SGI box; I have software tools for manipulating the VAX side but there appears to be NOTHING on the SGI system(s) for examining or tweaking Ethernet interface parameters.

I don't presume that you, yourself, necessarily know ANYTHING about this -- but I wonder if you could recommend anyone I could talk to about it? I've found it impossible to approach SGI on the "authority" of my customer's SGI service contract, because THAT expired before SGI had even gotten my customer's system up-and-running, and my customer is loath to pay by the hour for out-of-contract assistance. I am hoping that as a "fellow vendor" I might bypass this bottleneck. Any suggestions?

Thanks in advance for anything you can suggest.

3593. Looking for Jose Manuel Menendez Garcia

Newsgroup: comp.sys.atari.8bit
Date: 1991-01-27 04:28:34 UTC
From: Chris_F_Chiesa@cup.portal.com
Message-ID: <38516@cup.portal.com>
Source record: 114547

Sorry to post "personal" quests here, but I "met" Jose here, so perhaps
he is still reading this...

Am trying to reach Jose Manuel Menendez Garcia, last heard from by me via
e-mail to this username on or about November 12, 1990. Jose's username/
mail path at that time was

jmm@gti.upm.es

and it appears that some machine between me and he has since crapped out
as I can apparently no longer reach him via e-mail using that address.

I would like to hear from either Jose himself (with a working e-mail
address) or anyone who might shed any light on the sudden disruption of
e-mail contact with him after several prior exchanges...

Thanks in advance
Chris

To keep Kermit 65 from losing characters type Set Flow On before connecting,
I tried this and it works at 2400 baud, yet if you don't do this you may lose
characters at 24 depending on your application.

3595. PC <-> Atari DOS 3.0 conversion ?

Newsgroup: comp.sys.atari.8bit
Date: 1991-01-27 12:02:01 UTC
From: jbuhl@daimi.aau.dk
Message-ID: <1991Jan27.120201.20899@daimi.aau.dk>
Source record: 114543

Hi there,

A few questions:

Does anyone 'out there' know if its possible to make an IBM PC/AT read/write
diskettes in atari DOS 3.0 format - and how (strictly in software) ?
- I would very much like to download cc65, but I'm only connected to
USEnet by PCs, SUNs, and HPs.

In '89 I wrote a small ANTIC/6502 program for the 130xe, expanding it's
hi-res mode to 8 colours/greyscales. Is anyone interested in a posting of
this ? It's written to support the PAL-version, but I'm pretty sure no
problems will arise, using it with NTSC.

I wrote a screen-editor, allowing wysiwyg sub/superscript, underline, etc.
on a 80chrs/line display, allowing text and graphics to be mixed. If its
posible to tranfer this to a HP9000s300, would there be any interest in
a copy of this ?

Source record: 114551

Well, after receiving numerous replies to my request about using a 400 for
a terminal, I've come up with another idea.

What would it take to burn a term prg with my handler for my modem appended
to it onto ROMS to make my own cartridge? At atari.archive I've gotten the
source for a vt52 emulator with its source code in Action!, is it possible
to make a rommable prg with Action! ?

Any help would be appreciated.............

Hello 8bit-freaks,

I am very glad to see that there are still some people around who care for
the old Ataris. I had the fortune to obtain a 400, 800 and 410 for an apple
and an egg and are now looking for anything to enhance my collection. I am
especially looking for:

program cartridges and
memory modules for the 800.

Does anybody have the lightpen or original paddle?

Thanx in advance...

Okami-san

Ok, lets try this answer for the second time. This stupid netnews software
is the most unforgiving piece of garbage I have ever seen.

This will be abreviated from what you would have seen if I had been able
to post my first answer. There is a cartridge based Terminal emulator
called EXPRESS!. American Techna-Vision lists it in there ads for $67.95.
I have seen it reviewed but have never actually seen it for sale anywhere
locally. Call and see if they really have it for sale. The number in
CA is (415)-352-3787. Why not report back to the net what you find out?
Be sure to ask if it will work with your computer. Since it is a recent
development, it may only work with the XL/XE series.

I've heard of it too, but I don't want to spend nearly that much money!!
(Since I got the 400 for $20, and I already had the xm301 modem. I only
need use of it till June.)

Frank Seipel recommended finding on of the old Telelink cartridges, so this
may be a start. Does anyone have any information about them, like, will
they work with a 400 with 48K with a xm301. The 1030 modem had the handler
built in, but the xm301 doesn't. Or better yet, does anyone have one of the
Telelink cartridges they would like to sell?!?

3601. Atari computer system for sale

Newsgroup: comp.sys.atari.8bit
Date: 1991-01-29 23:49:07 UTC
From: walk@ux1.cso.uiuc.edu
Message-ID: <1991Jan29.234907.10698@ux1.cso.uiuc.edu>
Source record: 114406

I've changed my mind about how I'm selling this.
Give me an offer for anything that looks good.
I will post new updates as stuff is sold.

Note: to the person at sumax.seattleu.edu
My mailer dies sending to your address, so is it all right for me
to make my replies to your inquires on comp.sys.atari.8bit?

Atari Computer System for sale

All of this stuff is availiable to the best offer.
All equipment will be sold "as is" although everything except for the
things listed as inoperative worked the last time that I used them.

Pickup will be at Neoga, IL (between Mattoon and Effingham, IL on
Interstate 57; also about 70-80 miles south of Champaign, IL).
Otherwise I'll ship it to you (you pay for shipping).

Contact:

Todd Walk
RR 1 BOX 386
Neoga, IL 62447
217-895-3286 (best after 8pm)
walk@mrcnext.cso.uiuc.edu

Note on email: I don't check my email very often anymore, so you may have
to wait a few days for replies (but I prefer email).

(Note: you sent me messages before, if you are still interrested, please
email me again. My mailer died, killing the addresses I had saved.)

Another option would be either a Telenet I or Telenet II cartridge, from Atari. While these programs are very limited, they do provide the ability to log-in and probably could be found for under $10 (if you could find one, that is). These had the interesting ability to have data WRITTEN to them; one could store commonly dialed numbers on the cartridge.

Can anyone send me details of this useful thing. Specifically I
would like to know the connector types, pin to pin connections,
and the wire colours for each pin (if I'm disecting existing cables),
so that I can knock one together instead of mail ordering it.

While I'm at it, can anyone in the States tell me whether the following
were ever released by Epyx for the 8-bit Atari :-

Summer Games II
Winter Games
Impossible Mission.

Did Microprose release Gunship?

Finally, can someone give the address of what they consider the best
international mail-order firm for 8-bit stuff in America.

Thanks in advance for any help,
Mark Keates.

=>
The ICD Multi I/O & Black Box will both do this for you. There is
some other interface, but I don't recall the name. If you just want
to run a hard disk, the BB is probably what you want.
MyDOS & SpartaDOS (3.2d & X) will both handle it. Others might as
well, but I haven't heard of them being used.

I'd go with ICD's MIO if one is available, and Sparta-Dos is ICD's companion
dos for odd hardware on the 8-bit. Lessee... I think the MIO has a SCSI
interface... so a SCSI controller would be a neccessity also.

Lotsa bux the way I see it. Anyone got any of this USED for sale?

(for him.... not)

Well, Actually you CAN use the Hard drive with a 800xl..
Was that an MFM??

What youll need to do is to get either a black box, or MIO..
I reccommend the MIO, but some do prefer the box.
The Mio is a costly gadget though try to get one used..
Its avaliable from ICD..
Then youll need a controller board, and also youll need a case and
power supply...
Then theres the need for cords to hook everything up.
All this is attainable from ICD..
And its very costly as Ive said.
However, once you do all of it, you can order pro and run a great bbs.

I think I asked this here before, but it's been a while since I logged in
and probably missed the answer.

Could any 8 bit users out there give me the fix for changing Keith Ledbetter's
BBS Express into 80 columns? I'd really appreciate it.

From: wilmott@u2.rutgers.edu
Message-ID: <Feb.2.12.07.18.1991.4736@u2.rutgers.edu>
Source record: 114415
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

I'm not sure if Gunship was ever released for the 8-bit. Winter Games wasn't released by Epyx, but some other company did make a clone of it, though I forget who it was (Winter Olympics I think the game was called). Not very good anyway. Summer Games II - nope.

As for the best mail order Atari place in the US, for selection and price, I think I'd have to nominate:

B&C ComputerVisions
3256 Kifer Road
Santa Clara, CA 95051

Write and ask for their free catalog (or call 408-749-1003). A good selection of software, both commercial (even a few NEW things from independent developers/enthusiasts) and PD, and lots of hardware (refurbished systems, upgrades, cables, power supplies, repair parts, accessories, peripherals, etc)

-Ray

asked here many times before, but...

How does one subscribe to this newsgroup?

Thanks.

3614. ATARI stuff for sale: cheap!!

Newsgroup: comp.sys.atari.8bit
Date: 1991-02-02 19:09:45 UTC
From: smisra@eos.ncsu.edu
Message-ID: <1991Feb2.190945.9764@ncsuvx.ncsu.edu>
Source record: 114417

I want to sell the remainig stuff:

P:R: Connection, probably the most useful device to hook
up ATARI to the outside world..allows use of hayes compatible
RS-232 modems, parallel printers.. I will sell it for $35/obo
it includes shipping.

P:R: Connection: $35/obo shipping incld
Cables for P:R: $10 for both 6feet cables (modem and printer)

Software:

Print Master publishing program, prints banners, cards
anything $5 with shipping incld.

Vidtex: original copy with all nice compuserve Manuals
has macros that allow automated loggging on and more

$15 shipping incld/obo

Chess Master: $5/obo shipping incld

Please direct inquires, purchase requests to smisra@eos.ncsu.edu

3617. Re: MULE for Atari800

Newsgroup: comp.sys.atari.8bit
Date: 1991-02-03 22:23:48 UTC
From: mg20+@andrew.cmu.edu
Message-ID: <Ibf8poa00Uh783YxBO@andrew.cmu.edu>
Source record: 114422

MULE is an (awesome) Electronic Arts game. I had it for my 800 when I had an 800, before I got an ST. I don't think MULE is out for the ST... it's kind of "Out of Print". It only comes on disk, I'm pretty sure, and requires 48K (wow!)

Get a disk drive from somewhere, and a copy of MULE too. It's funny, detailed, and you can play it hundreds of times without getting bored.

BTW, cartridge games can be only <16K due to the 8-bit's architecture... pretty wimpy, considering some ST games require 1Mb (that's 1024K!)

Does anyone know where the best (and cheapest) place is to get an
adaptec controller for a MFM hard drive/MIO system???
I Killed the adaptec I have here and so I need to get one.
Someone post me where to order it.
Ill also need a few of the cords, but ICD still sells those..

3619. HiRes+8Colours for the 130(65)xe ...

Newsgroup: comp.sys.atari.8bit
Date: 1991-02-04 13:53:22 UTC
From: jbuhl@daimi.aau.dk
Message-ID: <1991Feb4.135322.29809@daimi.aau.dk>
Source record: 114421

Okay, upon an infinity number of request, here's the first program,
supplying the Atari 130xe with 8 colours/greyshades in 320x192 pixels
resolution (or 4096 in 80x192).

I made a little interface, allowing the routines to be called from
BASIC, but those of you who can see what's going on, shouldn't need it.
Anyway, IF you want to use BASIC at the same time, do not use the normal
graphics-statements, and do not press the 'Reset' key, since the fast &
efficent Atari BASIC will overwrite both image- and mcl-storage.

To activate the utility, run "RUNME.480", and when ready, use
DUMMY = USR(19984).
Hereafter you can switch back to the normal screen by typing
DUMMY = USR(20018), or plot a point with the (constant!) function
DUMMY = USR(20040, X, Y, C), 0 <= X <= 319, 0 <= Y <= 191, 0 <= C <= 7,
where 'C' is given by

```
C | color | R | G | B
---------------------
0 | black | | |
1 | blue | | | +
2 | green | | + |
3 | cyan | | + | +
4 | red | + | |
5 | violet| + | | +
6 | yellow| + | + |
7 | white | + | + | +
```

The colors R, G, B are located at 12290, 12289, 12291, and will
have to be changed on a NTSC TV set (I believe).
If you want more colors (= less resolution) try POKE 623, 64*N,
0 <= N <= 3, but note that this takes no effect on the plot-
routine.

> RUNME.480:

```

I believe there is a hardware hack to get a TTL monitor output from the XEP80. You might want to look into it. As for 80 columns via software, you are probably better off going with monochrome. A good Chroma/Luma split monitor (e.g. Commie 1702) works fairly well. I don't have the XEP80, so I can't comment on it.

Actually, cartridges from the past few years have been much more than 16k,
they use bank switching now and I have even heard of 1 meg cartridges...

> Of course, what do you do with a Meg on this machine?

Use it as a ROMdisk, of course. :) Like Sparta X's CAR: device, for example.
Files that rarely change, like executables, would be quite happy (and fast)
loading from ROM.

A cardridge can't span more than 16K of address space, but by using bank
selection the size is unlimited. The only practical limit is the ROM
technology and how many chips you can cram into a cardridge case.

Executing from bank selected memory can involve a few little tricks. Switching
banks while running in a bank can cause very interesting results. Either some
sort of ladder-like flipper is coded in the cardridge, or (better) a bank flip
dispatcher is copied down into RAM.

Flipping usually involves writing to a memory location. It's clean to decode
the cart's own address space for this, or some use the (I believe) $D5xx select
line. Say, for argument, you've got an 8-bit latch on the cardridge. Writing
to $A000 (the bottom of the 8k cart) writes into the latch. The cardridge sits
in an 8k address space, so it must use A0-A12. The latch supplies A21-A13,
which gives us an easy 2MB of space. Make that a 16-bit latch, and the limit
suddenly becomes 512MB. You want a BIG cardridge? :)

I thought that the cartridges could be more than 16k, after all, how would you explain some of the DISK-> Cartridge conversions like "Ace of Aces", "Leader Board", and some of the newer (but still old) releases?

I think that the 65 xe enables the use of these, but I have used the xe cartridges with my 800xl..

This isn't really true. Many years back OSS (does ANYONE remember these guys besides me?) put out several language carts and such that were 20 or 24k even. Best of all, none of those carts took up more than 8k of address space.

Lately, developers have taken this even farther. SpartaDOS X is a 64k cart that also consumes 8k at most (when it uses anything at all). Even Atari finally acknowledged that this could be done and produced several games cartridges. The largest one I ever heard of was Flight Simulator II, which was put on a 128k cartridge. Supposedly the maximum is 256k. Maybe I don't know all the restrictions, but it seems to me that they should be able to make a 1M cart. Of course, what do you do with a Meg on this machine?

The real trick with having a 1M cart would be arrainging the code so that
only 8/16k would be 'visible' at one time. But (sigh) we'll never know if
it can/will be done as there is hardly anyone left to do it.

From: potter@speedway.DAB.GE.COM
Message-ID: <10800@ge-dab.ge.com>
Source record: 114434

Mike,

I've just seen that Electronic Arts has released MULE for the (gasp) Nintendo. From the packaging, it appears to be much the same game, with the graphics enhanced a little. You're right, it (IMHO) is the best multi-player strategy game yet produced.

Jeff

Hi.

I am searching for any information on how I may obtain a 16K ram card
and an OS card
for my Atari 800. I have been unable to locate any advertisments about
these cards.

Any tips on where I might locate these cards would be most appreciated.

Thanks in advance.

Mike

Are you talking about files or the newsgroup.

I don't know if the newsgroup is available to a mail only site.

Files are availabe from Atari@atari.archive.umich.edu

Send to that address and in the body type: Send Help

and it will send you the help file. If you have any trouble let me know
and I'll forward the help file to you.

Atari Computer System for sale

All of this stuff is availiable to the best offer.
All equipment will be sold "as is" although everything except for the
things listed as inoperative worked the last time that I used them.

Pickup will be at Neoga, IL (between Mattoon and Effingham, IL on
Interstate 57; also about 70-80 miles south of Champaign, IL).
Otherwise I'll ship it to you (you pay for shipping).

Contact:

Todd Walk
RR 1 BOX 386
Neoga, IL 62447
217-895-3286 (best after 8pm)
walk@mrcnext.cso.uiuc.edu

Note on email: I don't check my email very often anymore, so you may have
to wait a few days for replies (but I prefer email).

Hardware

Atari 1020 printer w/pens,
Atari 410 cassette recorder,
assembled and working speech synthesiser w/spare parts, Uninstalled Rambo XL,
Atari 400 (16K),
inoperative 800XL w/ Omnimon/FastchipXL installed, 3 Transformers,
1 sets of paddles, 1 computer to switchbox cable,
1 periphiral connection cables, 2 working Gemstick joysticks,
2 working Silkstik joysticks, 1 working Pointmaster joystick,
many non-working Atari joysticks

Books

Atari Basic Reference Guide, Basic Reference Manual, De Re Atari,
Your Atari Computer, Compute!'s First, Second, and Third Books of Atari,
Mapping the Atari, Games for the Atari, The Atari Basic Sourcebook,
Atari Sound and Graphics, Atari Basic, Compute!'s Guide to Adventure Games,

3638. Re: HiRes+8Colours for the 130(65)xe ...

Newsgroup: comp.sys.atari.8bit
Date: 1991-02-07 23:26:47 UTC
From: potter@speedway.DAB.GE.COM
Message-ID: <10865@ge-dab.ge.com>
Source record: 114441

Hi Jesper!

Your HiRes+8 color program is similar to my COLRVIEW system. I typed
in your program (after correcting the mistakes in your posting), and
it appears you page-flip between a red, green, and a blue screen.
This has a real annoying flashing effect on my system. I considered
doing this about a year ago to get 4096 colors out of graphics 9.
Then I invented COLRVIEW, a program to view three graphics 9 picture
files. Instead of displaying a whole screen in one color, I alternate
colors on adjacent lines. Then I page-flip to three different screens:

```
Screen 1 Screen 2 Screen 3
RRRRRRRR GGGGGGGG BBBBBBBB
GGGGGGGG BBBBBBBB RRRRRRRR
BBBBBBBB RRRRRRRR GGGGGGGG
RRRRRRRR GGGGGGGG BBBBBBBB
etc. etc. etc.
```

The three screens contain unique information, and thus take nearly
24k of screen RAM. A display list interrupt changes the color of
every line, and a VBI sets the screen number by changing the display list.
It sounds awkward, but I got it to work.

The results are more pleasing than mere page flipping. A less annoying
vertical "washing" effect occurs, rather than harsh flashing.

I wrote a GIF viewer (APACVIEW) for the 8-bit that can decode to this mode
(alas, it can't also display in that mode, as there is not enough RAM to
support both GIF decoding and the 24k of screen RAM). My COLRVIEW program
will then display pictures created with APACVIEW. Both programs work in
either graphics 9 (4096 colors, 80H x 192V) or graphics 15 (64 colors,
160H x 192V). I also wrote a Degas (Atari ST) viewer for the Atari 8-bit
which decodes and displays directly in this mode. It is called DEGASRD.

Send me email if you are interested in these programs, or more details on
how it all is programmed. The results of some of these decoded images is
fantastic (IMHO). These are all available on GEnie and CompuServe. Some
time ago, I think somebody may have posted UUEncoded versions of one or
more of these. If you simply cannot find them, I can mail to you direct.

It's a business decision. They decided that a port of MULE to the
Atari ST and the Amiga simply wouldn't generate enough sales to be
worth it.

BTW, the author of MULE, Dan Bunten, currently has the rights to the
program. So if you could find him and offer him a cut of the
proceeds, you could probably get a license to do an ST port...

Cross-posted to: dfw.forsale,misc.forsale,misc.forsale.computers,comp.sys.atari.st,comp.sys.atari.8bit

I have the following Atari 1040 ST system forsale:

This includes the following hardware, in perfect condition:

1. ATARI 1040ST
2. ATARI COLOR MONITOR
3. NEW goldenIMAGE OPTO-MECHANICAL MOUSE (290dpi) AND MOUSE PAD
4. 2 EPYX 500XJ Joysticks

This includes the following software:

1. TDI MODULA-2 Version 3.00b (w/ registration card)
2. MEGAMAX C Version 1.1
3. Personal Pascal Version 1
4. Atari ST BASIC
5. FLASH (telecommunications software, w/ registration card)

This system is in perfect condition.
All cables and manuals are included.
The first $500 + shipping takes it all.
If you don't like my price, mail an offer.

Send me mail if you are interested.

Thanks,

3642. CLSN[?] Pascal

Newsgroup: comp.sys.atari.8bit
Date: 1991-02-09 00:03:14 UTC
From: njd@cbnewsd.att.com
Message-ID: <1991Feb9.000314.6846@cbnewsd.att.com>
Source record: 114445

Greetings all,

I was approached by a member of my user group at the last meeting, who wanted to know about support for CLSN (or is it CSLN? I didn't write it down immediately) Pascal. He says that he bought it some time ago from [the long defunct] Atari Program Exchange (here my memory is hazy also, he may have said "old Antic Catalog," but let's assume APX for the time being). In any case, it sounds like a non- commercial (at least ex-commercial) product for which there is no obvious support. He does say that it runs on his 130XE; I didn't gather what specific problems he's having.

So, I would appreciate hearing about any support available for this 'brand' of Pascal for the 8-bit Atari computers. (Since I'm one of the only two 8-bit users among our club's officers, and I like to get up and talk at meetings :-), I get a lot of questions. This one stumped me but good.)

Please DO NOT reply by mail ALONG THE PATH THIS ARTICLE TOOK. If you reply by mail (generally recommended so I've read), you MUST change the address to one of those in my signature block below, else it will NEVER get to me. (I'll spare you the explanation, if you really want to know, mail me.) I will try to remember to summarize any replies in a later post; if there is interest, let me know.

Thanks!

From what I understand, the OSS cartridges have 4k that is always resident and performs all the switching of the remaining 4k in which all other segments of the program appear. You're right though, I can't see anyone ever using anywhere near all that capacity.

>
> My request is this:would some kind soul find this article and copy out the
> table for me, or failing that, does anyone know the equations which will give
> me the correct values for these tables?

From the Hardware Manual:

The POKEY counters can be clocked at three different frequencies:
1.78979 MHz
63.9210 KHz
15.6999 KHz

The Normal Formula for output frequency is:

Fout = Fin / 2N

where N = the binary number in the frequency register (AUDF), plus 1 (N = AUDF + 1). The Modified Formula should be used when Fin = 1.79 MHz and a more exact result is desired:

$$Fout = \frac{Fin}{2\ (AUDF + M)}$$

where M = 4 if 8 bit counter (AUDCTL bit 3 or 4 = 0)
M = 7 if 16 bit counter (AUDCTL bit 3 or 4 = 1)

--

So, in your case, you'd want to use the formula

$$Fout = \frac{1.78979 \times 10^6}{2\ (AUDF + 7)}\ Hz$$

Hope that helps.

Source record: 114451

I have just spent the better part of the evening looking through every Compute! magazine I own looking for a particular article. Unfortunately, it looks like I do not have the issue I am looking for. The article in question described how 16-bit sound worked on the Atari, and more importantly, gave values for every note in all 9 octaves available when in 16-bit mode.

My request is this:would some kind soul find this article and copy out the table for me, or failing that, does anyone know the equations which will give me the correct values for these tables? Most importantly, please *POST* the message to the net. My private mail system is screwed up right now, and I can't receive my mail. My apologies to those who will have to wade through this stuff for no good reason.

Thanks,

Jeff

>BART service will no longer be available to access the Atari archive

This leaves us back where we were a few months ago. The panarthea archive isn't really an appropriate central depository of 'stuff'; that would impair its function as a newsgroup archive. As long as the enthusiasm and the resources exist at umich.edu, having a central repository there seems like a good idea. But ftp-only leaves a lot of us with pretty weak connections to it.

I have a couple of modest suggestions: In the IBM PC world, there's an ftp-only central repository at SIMTEL20. It is shadowed at (at least) 2 other sites, with mail servers at the shadow sites. There's a modest reduction in the disk load at the shadow sites because they can purge 'dead' files and re-fetch them only if needed. Traffic is decentralized. Any volunteers?

Another model is the UNIX/misc archives. Basically, they exist at 3 sites, with different access at each (although one of them, sir-alan, has been down for a rather long time). What they have in common, is that the requestor pays the phone bill. Anyone in a position to set up a bbs for the atari archive? A uucp-accessible site? Again, some degree of off-lining might be possible, although automating it might take a bit of effort. With both a bbs program and a uucp-clone having been distributed in this newsgroup, basic software availability should be a non-problem.

What all this requires is a couple hundred MB of disk, a cpu and at least one phone line. Ftp access would be desirable, but could be gotten around. The work involved would probably be too much for one person, but reasonable for 2 or more. Does either a shadow server or a second site sound like something someone wants to do? Any user group want to take on a BIG project? I suspect that a bbs with free and fee access levels could be kept from being a hopeless money-sink.

>exist at umich.edu, having a central repository there seems like a good idea.
>But ftp-only leaves a lot of us with pretty weak connections to it.

[various suggestions for allowing non-ftp'ers access to atari.archive deleted]

Your suggestions are good ones, Stephen, but they all sound like a lot
of work. Are you aware that there is a mail server at princeton
specifically set up to handle to remote ftp requests and send the
files to you by mail? Try sending the one-line message "help" to:

bitftp@pucc.princeton.edu

(Note: I haven't actually used this server, but I presume that it
works, since it's been around for a while. I think that there may be
similar servers located elsewhere, but I don't have addresses. Does
anyone else have any details on this sort of thing?)

3654. 2600 update

Newsgroup: comp.sys.atari.8bit
Date: 1991-02-12 13:16:27 UTC
From: tbc@cbnewsk.att.com
Message-ID: <1991Feb12.131627.13855@cbnewsk.att.com>
Source record: 114357

Just a thanks to all those who responded to my request for 2600 info.
The best general tip for such off the wall problems was to look for
a Sams book, which do exist for the 2600s and I assume for lots
of other beasties. Someone sent me a set of schematics which
was all that I really needed in this case.

The fix by the way was free. A coil that keeps the video out of the
5v supply had opened. A few turns on a ferrite bead did the trick.

There have been many complaints about BITFTP clogging up the net since it went into mail service--originally, it had a binary-only connection with BITNET nodes. Personally, I use bitftp, but NOT on Usenet, only on BITNET. If we overuse bitftp, it will probably disappear soon. So, use it, but check with your sysadmin and/or your feeds first, and use it responsibly.

I am the manager of the USENET and electronic mail gateway between Digital Equipment Corporation and the rest of USENET. The unfortunate incident for which Mr. Kaiser has been so cruelly blamed was completely an accident, and is the result of a "culture clash" rather than any malice. It is perhaps best not to use harsh words until you have finished understanding an incident.

Hans Kaiser works in Digital's software support office in Stuttgart, Germany. Like most Digital field offices, it is equipped with VMS computers and connected to Digital's DECNET network. The converstion between internal DECNET and external protocols is performed by the DECWRL computer for which I am responsible.

VMS and DECNET do not have the concept of queueing mail. When you send a message, either it is delivered instantly or it bounces. The idea is that you want the sender to know instantly if his message did not get through. As a result, VMS mail users have, through the years, grown accustomed to believing that if they do not get a "message sent" message, then their message did not get sent.

Whenever mail is relayed from one network to another, rather than just queued, the concept of "immediate delivery" is somewhat meaningless, because you haven't really delivered the mail, but rather have just handed it off to some intermediate postman. But user expectations are still very strong: if a user sends an internetwork message, and doesn't get back a "message sent" reply, his experience leads him to believe that the message was lost.

Last week we had a head crash on the primary disk on our DECWRL relay computer, and for various reasons it took almost 3 days to get the machine back up. We announced this failure on the appropriate internal Digital newsgroups (dec.mail.config), but did not send individual notification to the tens of thousands users of the gateway, as we sometimes do when we are certain that it will be down for a long time.

During this interval Hans Kaiser was trying to retrieve files from the Atari archive server. He is not a reader of dec.mail.config and probably did not know that the gateway was down. He sent some retrieval requests, and got no reply.

Here comes the "culture clash" that I mentioned in the first paragraph.

When a VMS user sends a mail message that does not get delivered, he is conditioned to believe that it has been lost or deleted, because that is what happens in the normal case. However, these messages that Kaiser sent were neither lost, nor deleted. They were carefully queued, waiting for the DECWRL gateway to come back up again, so that they could be sent.

When he got no response, Kaiser sent more requests. This is the natural thing to do in the VMS world. If it didn't work, and if you are following instructions, then try again. Maybe something will have been fixed. I don't know exactly how many times Kaiser repeated the request over the 3-day interval, but I am sure that if he had known that his messages were all being queued, instead of vanishing as he thought, that he would not have repeated them.

Eventually (I think it was on Wednesday night, California time) the DECWRL gateway was brought back to life, and all of the queued messages were sent to the Atari archive server in one lump. Archive servers are in general programmed to have per-user quotas, so that if something like this happens, it won't bring the archive server to its knees trying to handle so many requests at once.

Alas, here the "culture clash" strikes again.

The DECNET mail protocol does not support a "time and date" mechanism. The only information that it records about a message, besides the message body, is what we Unix/IP people know as the "To" and "Cc" and "Subject" and "From" fields.

In DECNET protocol it is up to the receiver of a message to timestamp it with the time that it was received. The reason for this is that since there is no queueing, the time that a message was received is guaranteed to be equal to the time that it was sent. As a result, the network mail protocol has no mechanism to record the time that a message was sent.

The documentation for the DECWRL mail gateway, which we distribute to all employees who ask for it, instructs them to use the gateway by sending mail with a certain mail program that is not part of the software that Digital ships to its customers. This program, called "nmail", is helpful in smoothing the peak load on the gateway by queueing at certain times. However, since the mail-sending software knows that the mail might be queued, it records the time that the message was actually originated. This is because the "Date" field in the message will contain the time that it was delivered and not the time that it was actually sent. "nmail" does this by adding the date and time to the "From" field of the message. It really doesn't have much choice, because the DECNET mail protocol supports only a "To", "Subj", "From", and "Cc" field, and there is a fixed limit to the size of the "Subj" field.

Why does this matter? It matters because the Atari archive server at the University of Michigan looks at the "From" field of an incoming message to avoid processing too many simultaneous requests from the same person. There is a "per-user" quota for each day. The problem is that when you send the mail using a mail program that encodes the date and time of the message in the "From" field, then every message looks like it came from a different user.

As a result of this, when the DECWRL mail relay came back to life last Wednesday, it sent many dozens of retrieval requests to Michigan all at once, and Michigan's software failed to understand that they were all from the same person because the "From" field on each of them had a different date and

time. As a result, the Michigan archive server tried to process all of them at once, and, evidently, melted into a pile of slag.

Since I work for a company that sells computers, I suppose the loyal thing for me to do at this point is to try to sell Michigan a bigger computer to use as the archive server, but I don't work in a sales office, I work in Corporate Research, and what I want is for everybody to be happy. I am very sorry that a combination of accidents inside Digital, in Germany and California, caused this unfortunate incident on a university computer at Michigan, and I will happily offer the services of the excellent network programmers at DEC Western Research to help ensure that the Michigan archive server does not meet this fate again. Mostly I want people to know that this was in no way the fault of Hans Kaiser. If it was anybody's fault, it was my fault, for accidentally failing to copy the serial number of a certain disk drive onto a service-contract renewal form for 1991, thereby leaving the disk unprotected by maintenance contract. Disks often fail on purpose when they learn that they are not covered by maintenance contract.

If you have sent Mr. Kaiser (or Herr Kaiser, as he probably prefers to be called) a nasty message, it might be civil to send him another one letting him know that, now that the facts are known, you aren't so angry any more. If you find the need to be angry at somebody, please be angry at me. As the manager of an electronic mail gateway, I'm used to it.

Brian Reid
DEC Western Research Laboratory

3658. BART: part 2

Newsgroup: comp.sys.atari.8bit
Date: 1991-02-12 18:14:33 UTC
From: brode@math.lsa.umich.edu
Message-ID: <1991Feb12.181433.3661@math.lsa.umich.edu>
Source record: 114360
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit

This is a re-post with clarifications of my original article "Bye Bye BART".
The original has been cancelled.

The BART mail server is no longer available at atari.archive.umich.edu.
My understanding is that it is down for good, but I haven't had an
opportunity to really discuss it with the system administrator yet.
Perhaps he will permit it back with some additional patches to the
quota system. I don't know.

As for Herr Kaiser, he is directly responsible for the server being shut
down, but my characterizations of his actions as malicious were pre-mature.
Due to some unusual circumstances, some of which were very clearly explicated
by Brain Reid, it appears that I misjudged him initially. I have received
several messages from Hans apologizing for the trouble he caused and some
messages from his administrators backing him up. I apoligize for the harsh
words, it appears most of them were unjustified.

At this point, I don't know whether I believe his innocence or not. Even
taking the unusual circumstances into account, he was still using the
archive beyond the posted limits. However, I'm not in a position where
I'm able to ascertain his innocence or guilt so I will no longer pursue it.

Please stop sending him mail.

Below is my response to Brian Reid's article for those who are interested.

Jon Brode -- jon@atari.archive.umich.edu brode@math.lsa.umich.edu
University of Michigan, Atari archive manager

In article <1991Feb12.165927.21941@pa.dec.com> reid@wrl.dec.com (Brian Reid) writes:
>There is a "per-user" quota for each day. The problem is that when you send
>the mail using a mail program that encodes the date and time of the message
>in the "From" field, then every message looks like it came from a different
>user.

Exactly. We knew the quota system was unsohpisticated, but it should have
been sufficient to keep the average user in check. The problem of keeping
a hacker from abusing a totally automatic mail archive server is very
difficult, and perhaps impossible to solve for now.

>As a result, the Michigan archive server tried to process all of them
>at once, and, evidently, melted into a pile of slag.

Actually, we received them over the course of 4 days so it seemed like
he was sending them interactively. I probably would have been suspicious
of mail problems if all 93 messages has shown up within minutes of

each other.

>I will happily offer the services of the excellent network
>programmers at DEC Western Research to help ensure that the Michigan archive
>server does not meet this fate again.

Most appreciated. Perhaps you can share with me your thoughts on parsing
incoming From: lines so that everyone has to play by the rules.

>Mostly I want people to know that this was in no way the fault of Hans Kaiser.

I'm not sure I'd go that far, but my initial posting about the extent
and intent of the archive abuse were definitely in error.

>If you have sent Mr. Kaiser (or Herr Kaiser, as he probably prefers to be
>called) a nasty message, it might be civil to send him another one letting
>him know that, now that the facts are known, you aren't so angry any more.

I concur.

Yes, One would cost you about 79.99 from all major mail order houses.
A used one should be about $50 or less in places. Its still a hot item.
IF you need to know where to order one, lemme know.

Greetings, O friends of the 8-bit,

It seems to me that I've already tried posting this article once, but got no replies, and I don't remember seeing it show up in the newsgroup on this machine. So (my apologies if you've seen this):

Does anyone out there have any info about support for CLSN Pascal? Someone in my user group asked me about it (I guess because I'm a club officer & 8-bitter, he figured I was a good bet...) and I promised I'd ask. He says he runs it on a 130XE, if that's useful info. (I had never even heard of CLSN Pascal before this!)

Thanks! BTW, if you reply by mail, use one of the 'odutsa' addresses below. (Replying along the path this article took will doom your message to oblivion, and udt386's Internet link is 'down'.)

Now the situation is becoming clear. I'm supposed to use a network like
that at work, and the experience is a real shock to a Unix-user like me
(I hope that isn't called a Unich!). When I send mail to Vancouver,
which is 5000 km and 4 time zones away, if my VMS system doesn't connect
it does not send the mail. No queuing! No wonder Herr K. got confused.

If there is a message in all of this, it is that before we flame
individuals in public and pillory them by name, we should send mail and
ask for an explanation. Something about a fair trial...

I think that between his responses and Brian Reid's posting it seems pretty unlikely that any malice was intended. Of course you are upset at losing your server -- we all are -- but having used VAXmail I can vouch for the plausibility of Kaiser's and Reid's explanations. Your accusations have caused a lot of grief for Kaiser and DEC, and your waffling about whether to accept their explanations is rubbing salt in a wound that seems to have suffered enough.

>Please stop sending him mail.

I concur. When I read your original posting I forwarded it to him with the header "Is this true?" and I received a gracious reply and copies of subsequent correspondence. My conclusion is that Herr Kaiser did not act with malice, and that he was not even overly negligent (a real guru might have avoided the problem, but it does not appear to be a really slovenly mistake).

Right now the problem is overly strict system administration at your end.

Guess what? Dont even waste your time calling Start.
I tried them and if you look very carefully their Add says "limited quants"
act right away.. Reading that, I called and was told that they didnt have
anymore..
The only way to get one is used or via the "usual" outlets for $80 or if
you prefer. $79.99..
Not worth it.

>wound that seems to have suffered enough.

I accept Brian Reid's technical explanation without question. The only thing I had my doubts about was Herr Kaiser's complete innocence. I am not of the opinion that the technical difficulties excuse all of his actions. However, my remaining doubts about Herr Kaiser are not worth pursuing.

Besides, if you want to talk about rubbing salt in old wounds, why did you post this after I told you that Hans and I have worked out our differences?

>My conclusion is that Herr Kaiser did not act with malice, and that he
>was not even overly negligent (a real guru might have avoided the problem,
>but it does not appear to be a really slovenly mistake).

So you're saying that it takes a guru to figure out that if you don't get a response from the first 45 messages, you probably won't get a response from the next 45? Now reconcile that with the posted archive limit of 5 requests per day.

>Right now the problem is overly strict system administration at your end.

Not at all, we are a guest on that machine. We can use it as long as we don't cause trouble. People use that machine to get work done. The archive is just a public service, the University doesn't even support Atari machines. (major m*c site)

Anyway, things are looking better in this regard as well. It appears that the sys-admin's intention is to keep us down until we can come up with a technical solution to the basic problem that's at the heart of the matter: a weak quota system. The difficulty is that coming up with a bullet-proof quota system is an insoluable problem at present. The trick is convincing the sys-admin to let us go back up with a partial solution. I think I can swing that, he's a reasonable guy.

Does anyone have the source for the old BBC or CBM-64 version of this game, as I am interested in the 3D routines, and also the algorithms for planet naming, information etc. Better still, if anyone knows anything about the elusive Atari 8-bit version, let the world know.

I assume that the source is under copyright (Acornsoft or Firebird) but you learn more by looking at the source than simply playing the game, and I'm sure many demo writers, up and coming programmers, (hackers) call them what you like have resorted to scouring through impressive routines in their time (and probably used them too).

Any agreements/disagreements to the above are welcome, but don't let it deter you from posting the source!

3667. Sam Tramiel in conference on CIS

Newsgroup: comp.sys.atari.8bit
Date: 1991-02-16 06:34:38 UTC
From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <39323@cup.portal.com>
Source record: 114370

Sam Tramiel, president of Atari Corp. will be the special guest at an online conference this Thursday in the CompuServe Electronic Convention Center. That's Thursday, Feburary 21 at 10 PM, Eastern Standard Time.

As a special service to Atari owners, CompuServe is making the conference available *FREE* of normal hourly connect charges..!

To enter the Convention Center, just type GO ECC after logging into CIS.

If you have a CompuServe account, or know someone who has, this will be a wonderful opportunity to listen to, and talk with, the head Atari Corp.

If you don't already have a CompuServe account, you can call 1-800-848-8199 (ask for operator 198) and request a free signup kit which includes some free connect time... unfortunately I don't know if they would be able to get it to you before Thursday...

3673. Questions about Xformer, by D. Mihocka

Newsgroup: comp.sys.atari.8bit
Date: 1991-02-18 23:18:01 UTC
From: jfbruno@rodan.acs.syr.edu
Message-ID: <1991Feb18.231801.12060@rodan.acs.syr.edu>
Source record: 114376
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit,comp.sys.atari.st.tech

Perhaps someone can answer these questions about Darek Mihocka's (Hope I got the spelling right...) 8-bit emulator Xformer?

1) What are the pinouts for the Xformer cable (to hook up the 8-bit's drive)?

2) How does Xformer handle input from the joysticks? Are all 4 of the 8 bit's joysticks supported? Are only two? Do they plug into the ST's Mouse and joystick port? How about the "Paddles"?

3) How well does it do with disk based copy protected games? Does the "virtual floppy support" (files on hard disk) support disk based copy protection?

4) How fast is it compared to a normal 8-bit?

5) Could someone post the source code for Xformer 2.55 to terminator (Darek said it's now PD and is on Genie, but I don't have an account there. Has it made it to Compu$erve, or anywhere else I can get it?

6) Has anyone tried M.U.L.E. or Seven Cities of Gold on it yet? If so, how did they work?

Thanks for any help,
---jb (jfbruno@rodan.acs.syr.edu)

Source record: 114387

Hello :-)

I have been experimenting with Atari 8-bit BASIC and the joystick routines. I have gotten to the point where I can move an object around the screen, and can locate the an item that might come into it's path.

Now I would like for the jostick to pass over many items, and replace them after it moves over it. Say that I have an "l" poked to look like a heart, after the joystick passes over the heart, it would re-appear.

I have a problem in that the cursor leaves a trail behind it, covering over anything in it's path with the current shape of the cursor.

Thanks... and if that made sense.. please reply!

You aren't doing anything wrong. The Menues will appear only on the 40
column screen because it takes too long to send them to the 80 column
screen.
To solve your problem either build a line switcher (input from computer
and xep80, output to monitor) or buy a cheap one from radio shack.

I haven't programmed the 8-bit in years, but the following should work. You
may not be restoring the background explicitly, which you need to do.

```
10 GRAPHICS 1+16:REM or any other text mode
20 X=0:Y=0
30 LOCATE X,Y,Z:REM get "background"
40 POSITION X,Y:? #6;"l";:REM put your image on
50 IF (STICK(0)<>11 AND STICK(0)<>7) THEN 50
60 OLDX=X:IF STICK(0)=11 THEN X=X-(X>0)
70 IF STICK(0)=7 THEN X=X+(X<19)
80 POSITION OLDX,Y:? #6;CHR$(Z):REM **********RESTORE THE BACKGROUND**********
90 GOTO 40
```

This simple example of course only works with left/right motion, but the
STICK(0) statements could easily be expanded.

Hope this helps...

Since TRAK is long out of business there are no schematics available.

I traced the PC board traces and discovered that all you need is a
ribbon cable with the appropriate ends on them. For the Slave drive
you need a SS/DD drive, and a straight through ribbon cable. Put the
standard "card edge/slot" floppy connector on the floppy end, and
you should be ready to go. The printer is the same, but for a DB25
connector with the standard IBM pinout. If you need the actual
pin for pin drawing, send me email and I'll check the cables at home
and let you know what the wiring diagram is.

Dream on.

Posting a copyrighted source to the net without the express permission
(in the unlikely event that anyone outside the company has the source)
of the copyright owners would be illegal, and an extremely serious abuse of
the network. I find it amazing that anyone could be so ignorant of the
realities of copyright that he could even suggest such a thing.

Saying "it would be very useful to me" does not contravene an
international convention made law by just about every country the
InterNet goes into.

Why waste your time with a crummy 400?
Its a junk heap compared to some of the newer models.
The keyboard that thing has (if you can call it a keyboard!)
Isnt worth paying to replace. The best thing you can do is
to buy a used 600xl, or 800xl.. Ive seen these advertised for
$25-$45 used.. It would pay to upgrade to a 800xl. Then you can
use RAMBO xl and get 256k ram for ramdisks.
You could also be able to add neat gadgets like the MIO and
hard drives too.
The 400 is not really worth it. Im not sure, but I dont think its
got any advantages to any of the newer models.
Anyways you can get a replacement keyboard for 12.50 from
American Technavision. 1-800-551-9995
Its the same Flat Horrid membrane sold with the thing originally.
Good luck!

The 400 has four joystick ports, which makes it the only model other
than the original 800 which supports a four-player game of M.U.L.E.
All other models of the 8-bit are therefore inferior by comparison.

> The 400 is not really worth it. Im not sure, but I dont think its
> got any advantages to any of the newer models.

One can also say that the newer models have no real advantages over
the 400.

I know of someone who did Atari service in the good ol' days and still has some of the Inkey B400 replacement keyboards. These are third party keyboards which have movable keys on them. They are meant to be replacements for the original membrane keyboards used on the Atari 400. My first Atari computer was a 400 and I used one of those keyboards for quite a few years until I got my 800XL. He doesn't service home computers anymore, he only deals with coin operated arcade games (video, pinball, etc.). He is selling the remaining keyboards (new, unopened) to people who can use them for $10 each plus the shipping costs (varies depending on location and method).

Hi Frank,
You may want to call Best Electronics, they probably have the
largest supply of old (and new!) Atari parts and componets. Best's address is
as follows:

Best Electronics
2021 The Alameda, Suite 290
San Jose, CA 95126

Phone: 408/243-6950

When you call them, also ask for thier new catalog; it is has almost
every Atari part known to man! Well relatively! {;^) Bye.....

3690. MIDI interface

Newsgroup: comp.sys.atari.8bit
Date: 1991-02-21 21:27:45 UTC
From: foster_663@oscar.ccm.udel.edu
Message-ID: <45418@nigel.ee.udel.edu>
Source record: 114395

I was wondering if any one knew of a company which makes an interface
for MIDI (i.e. keyboards) conrtoll and sequencer programming. I own a 130XE
and a 600XL so I could use the 'Expanded Cartridge Interface'.

If no one knows where to find one, would it be possible to build
one which uses the joystick ports as output/input ? I have several old
ANTIC and ANALOG magazines which explain how to use the ports for some
types of computer controll of external devives (such as a speech synthesizer)
but none of them are very explicit.

(I did hear a company called Hybrid Arts made one ONCE but...)

Any info would be most helpful

Source record: 114397

Hey! There are some good things to be said about the 400: it has 4 joystick ports! Some of the older games looked for all 4 ports... if they didn't see 4 ports they crashed... My copy of MULE wont run on any of the xl's... runs on my 800's fine (and a friends 400)... another friend's 800xl goes off into the twilight zone when we run MULE...(he's rather pissed about it too...(he had a 400 but lost it in a move))... and anyway... the guy who started this thread was just looking for parts... for all you know his 400 could have been the first computer he owned...(an 800 was my 1st machine and I wont give it up for nuthin'...kinda nostalgic...(I bought it in '81))...

anyway of other things: I know that there must be a version of mule more recent than the one I have that will run on an xl...(I seem to remember a thread about mule recently, and I can't believe that everyone that was raving about it had 400's & 800's) so could someone drop me a line about it...

also does anyone know if it (MULE) will run on an st w/ xformer?

Its great to see people still care about the ol' Atari 8-bit machines.
An Atari 400 was my first computer back in 1981. I still think it was the
best of the time (not to bring back the old C-64/Apple/Atari Battles).
I still use an Atari 800XL for games and general messing around--it sure
is a lot more FUN than my PS/2.

I bought my Atari 400 at a garage sale for $15. They also had an
Atari 800 for $50. I wouldn't pay more than $50 for any of the 8-bit
machines now; you can buy them retail at some places for about this
amount.

Re disk drives: B&C ComputerVisions in Santa Clara, CA sells
reconditioned 1050's for $135 and new 810's for $130.

B&C ComputerVisions
3257 Kifer (between lawrence and bowers)
Santa Clara, CA
408 749 1003

They also have 8bit Ataris for sale there, too. Call and ask for
prices before spending money at the thrift store.

(stuff deleted)

I've built a simple MIDI interface that hooks to the SERIAL port
of my Atari 800 and my CASIO CZ synth. Surprisingly, the serial port speed
can be boosted up to the 31K baud rate that MIDI requires by modifying
some of the POKEY registers. The interface consists of a 7404 inverter chip,
a transistor, several resistors, a serial port plug, and two midi plugs.

A few simple programs in assembly & basic are used to record and playback
through the synthesizer. I've also written a CIO "V:" handler so that I can
use it just like any other device from BASIC.

If anyone's interested, I can post the schematic and software.

> like to play on the Atari. How much would an old disk drive cost me?

Theres 2 possiblities for this model.
1) 800xl, 2) 600xl.
For $125 new, thats not a fair price. If its a thrift store,
that means its used and thats even more of a ripoff.
IF you want an atari, call San Jose. I dont have the number, but
they sell 1200xls for $69 reconditioned.
IT comes with pac man i think. and they had some option where you
get a lot of crazy printers and accessories with it.
the 1200xl isnt great for someone who wants to expand a system.
YOu cant add an MIO, but it will work with almost all of the software.
The main difference is that the 1200xl has a better keyboard.
Theres other differences, but if your using it for games, then you
wouldnt care. Im sure someone here knows more about it than me anyways.
I used a 1200xl for years and years and had to upgrade to a 800xl
because I wanted to get an MIO and hard drive setup.
Ive been despising the keyboard on this thing ever since.

From: dddean@bluemoon.uucp
Message-ID: <J9NsX1w163w@bluemoon.uucp>
Source record: 114305

Hello ;-)

I have heard that it could be done, and I would like to do so. Is there a possible way to set-up a 3.5" disk drive for an Atari 8-bit? I have an 800xl, and would like to try this.

What all would I need, and could someone quote me a price?

Thank you for any response.

I am also looking for a Hard Drive for the 8-bit... (I know... "Why???") I think that it might beneat to do this... kinda max-out mu 8-bit and make it a novelty!

There exists a hack to modify an Atary XF551 5.25" drive to use a
3.5". For the most part I understand it is fairly simple, but it does
require a new EPROM to use the whole disk. I have a vendor & price,
but they are at home. :-(

The vendor is:

Innovative Concepts (I.C.)
31172 Shawn Drive
Warren, MI 48093 USA

Phone: (313) 293-0730
BBS: (313) 978-1685
GEnie: I.C.
CompuServe: 76004,1764

As for the current price, I don't know the kit was going for around $40 about
8-9 months ago. I'm sure it hasn't changed.

As for the hard drive: Read the previous post by Gary Duzan(?).

3705. M.U.L.E. Sorrow!

Newsgroup: comp.sys.atari.8bit
Date: 1991-02-25 00:29:59 UTC
From: Chris_F_Chiesa@cup.portal.com
Message-ID: <39563@cup.portal.com>
Source record: 114309

After all the recent mentions here of M.U.L.E. (probably THE BEST game ever created for the 8-bit Atari), I went to play MY copy thereof, for the first time in ages, only to find that it would no longer boot. I get about three or four sectors read in (i.e. three beeps), then the system locks up. I can only assume the disk has "gone bad" with the passage of time, although this is one of only a handful out of hundreds I own that shows this kind of deterioration.

Anyway, can anybody suggest a course of restoration? Anything _I_ can try on my disk, any way to obtain a fresh copy (I assume the original authors have long since moved on to other places and projects), anybody looking to SELL their copy?

Tnx for any help...

Chris

It may be the case that your drive has slightly changed speed over the years.
Archaic protection schemes sometimes involved precise disk drive alignment.
Though I am not completely familiar with the principle, I hypothesize it
is something like this: some diskettes, when formatted specially, can be
read faster than other diskettes. The DOS III (ugh) master diskette was
so formatted, and it said so in the manual -- it also said if you reformat
the disk, you will lose this "fast sectoring."

I would guess that a viable protection scheme would be to fast sector a disk,
so that the sectors take a specific (short) amount of time to read in. The
protection code in the program would time the disk read. If the disk read was
slow, this would mean that the diskette was a copy since the fast sectoring
could only be produced on specialized hardware.

Thus, a drive out of alignment may read the diskette in slower than usual,
leading the program to the incorrect conclusion that the diskette is a copy.
Re-aligning the drive, perhaps, may help.

This is, again, only my hypothesis, after playing around with a few Electronic
Arts games. I'm sure that few people would be concerned at this point about
keeping such archaic copy protection schemes secret, so can anyone shed any
light on exactly how it was done? I've always wanted to know.

This sounds like the sector marks have wandered. The only thing you can do
is to attempt to restore them. Unfortunately, a normal Atari drive won't do
it; you'll need a Happy-modified (or one of the equivalents) drive to go in
and read the sector, bad header and all, and to rewrite it.

>Anyway, can anybody suggest a course of restoration? Anything _I_ can try
>on my disk, any way to obtain a fresh copy (I assume the original authors

You could always contact Electronic Arts; you never know; they might have a
copy lying around..

> It may be the case that your drive has slightly changed speed over

> The DOS III (ugh) master diskette was so formatted, and it said so in
> the manual -- it also said if you reformat the disk, you will lose
> this "fast sectoring."

Actually, that was never widely used as a protection scheme on Atari
disks. The normal speed of an 810 was 300 RPM, but they tended to
wander quite a bit. Additionally, buffering drives (such as the
Indus, or the Happy-modified 810s or 1050s) read in a track at a time
off the diskette and buffered it internally, thus causing any software
which depended on timing to fail horribly.

The "fast sectoring" format was also controllable with a modified 810 or 1050.
All that was was changing the sector order on the floppy to allow faster reads
and writes due to having the sectors in an order which cut down on the number
of revolutions required to seek the next one. Unfortunately, it's been a long
time since I played with sector formats, and can't recall the standard vs. the

fastest sector format (I think it was 1,4,7..., but am not sure).

You are correct in stating that the fast sectoring could only be produced on specialized hardware, but the flaw is in the timing on the disk read. You couldn't count on any degree of accuracy, because of the possiblity of a missed sector, or just that the drive speed was out of range. You could, of course, create bad sectors on a standard 810 by writing to a sector with the RPMs altered to be out of the allowable tolerance (< or > 20RPM, I think).

> Thus, a drive out of alignment may read the diskette in slower
> than usual, leading the program to the incorrect conclusion that the
> diskette is a copy. Re-aligning the drive, perhaps, may help.

No, it honest sounds as if he's suffering from bitrot. Remember, magnetic media has a definite shelf life, and that's probably what happened. Also, the alignment doesn't have anything to do with the speed of the disk; it will affect how well it tracks the disk. (although, I suppose if it has trouble tracking the retries will slow disk operations down.. :-)

> This is, again, only my hypothesis, after playing around with a few
> Electronic Arts games. I'm sure that few people would be concerned at
> this point about keeping such archaic copy protection schemes secret,
> so can anyone shed any light on exactly how it was done? I've always
> wanted to know.

Hell, we never kept them secret when they were new. :-) The most common (and difficult to reproduce on a normal drive) were modified low-level disk formats -- duplicate sector headers, short sectors (VERY common; you'd check to see how much valid data was read in; if 128 bytes, blam!), and just plain ol' unreadable sectors. One game I saw (by First Star; can't think of the game) had every other sector on the diskette unreadable -- but it never checked for their presence; I suppose they felt that anyone who spent all that time just trying to copy the game deserved it for free. :-)

Boy, does this bring back memories. Anyway, to answer the original question, unless you have access to a modified drive, you're most likely out of luck unless you can contact Electronic Arts and ask them for another copy, or ask it you can copy one from someone else. I don't think they'll mind, and you'll sleep better at night. :-)

>Tnx for any help...

Good luck!

>course, create bad sectors on a standard 810 by writing to a sector with the
>RPMs altered to be out of the allowable tolerance (< or > 20RPM, I think).

Indeed so; I used to create bad sectors by using a simple USR call to the resident disk handler to write a sector, and while it was writing the sector I wedged a piece of folded paper in between the diskette jacket and the top of the drive slot, so that the increased pressure on the diskette would bring it almost to a stop. I'm sure it did wonders for my diskette, to mention nothing of the disk drive motor... but it did create bad sectors by altering the RPM in a very crude manner. What I am still not quite sure about is -- why does altering the speed create bad sectors?

>The most common [means of copy protection]
>(and difficult to reproduce on a normal drive) were modified low-level disk
>formats -- duplicate sector headers, short sectors (VERY common; you'd check
>to see how much valid data was read in; if 128 bytes, blam!), and just plain
>ol' unreadable sectors.

Very interesting... "plain ol' unreadable sectors" had occurred to me, as they were the most obvious to detect, but short sectors and duplicate sector headers... What would duplicate sector headers do? Short sectoring seems quite ingenious too, though how could you tell how much "valid" data was read? Let's say you're using SIO to read a disk sector into memory, and only 100 bytes are "valid"; what would the rest of the target buffer in RAM contain? Garbage? Unchanged? Zeroes?

As you said, how this brings back memories. :-) I recall one time disassembling the code to some game (forgot what it was) to see how the copy protection worked. It was incredible how almost incomprehensible the code was; 25 or so pages of self-modifying, self-decrypting, partially-resident-and-partially-loaded-from-disk security checking. Pretty clever, these copy-protectors...

3.5"-- the way to get one of these is to somehow obtain a costly
disk drive known as the xf551. This was made by atari and its
double sided/double density. No one I know of will part with theirs,
so good luck! Once you get one of these, youll need to buy a 3.5 mech and
have someone know knows how to mount it, put it in. Im told its not
that hard to do. (ive never done it. I dont know!).
I dont know if theres a 3.5" made by another company, but ive heard of
peripherals that allow IBM PC drives to be connected. Im sure someone
here could write more.
As for a hard drive, youll be opening pandoras box, but you could
get one hooked up.
Youd need either a black box, or MIO.
Then youd need wires.. (from ICD)
Then youd need the drive.. and the appropriate controller board.
Then a case and power supply.
Ive spent a considerable amount of time obtaining this stuff.
Its not easy.. The controller boards are hard to get.
I found a supplier though, look at the old messages Ive posted here about
it, or send me email and ill give you more info. Ive already posted it
and i dont have it handy right now.
The best thing to do is to call ICD, They have the stuff youll need
as a kit of some sort. IM told its expensive and a rip off, but its
very very hassle free.

I am posting this for a friend. I'd prefer if you'd contact him directly, but I guess, you can leave me your name and phone number and I'll forward it to him.

Here's a listing of some 8-bit stuff I'd like to sell.

1 Atari 800 w/ 48K RAM
1 Atari 800 w/ 32K RAM (other 16K of RAM chips still good but on an unfinished upgrade attempt)
1 Atari 410 program recorder
1 Atari 800XL w/ 64K RAM
1 Atari XF551 Drive
1 Goldstar Mono monitor
1 Epson LX-86 Printer
1 XM301 modem
Numerous joysticks & paddles
Numerous software both commercial and public domain
Numerous cartridges

All items work, but the Flight Simulator Disk must be used on a 1050 drive instead of the XF551, because of the different speed on the drive.)

I can be reached by voice number at 916-893-3533. Make me an offer.

What DOS are you using? Atari sold a lot of XF551s with DOS 2.5, which
treated the drive as if it were just a 1050. The rest were sold with DOS XE,
which recognizes the drive as DSDD, but is incompatible with a lot
of other programs. Either Mydos, Spartados, or Spartados-X will work with
the 551 in DSDD mode.

You need more than just the 3.5 inch drive mechanism. You also need a new
ROM for the drive. Upgrade kits are available from Innovative Concepts in
Michigan, or from CSS (who also make the Black Box.) CSS has a new
deluxe upgrade that lets you use the 5.25 and 3.5 inch drives as different
drive numbers, and they claim it can even read and write IBM or ST disks.
The price is something like $139.95, including 3.5 inch drive. (Not sure
if that's the exact price--check their ad in STart.)

That was the oldest (and just about the easiest) way to create a hard bad sector on the Atari. One of the oldest programs I saw to do it (I think it was for sale in ANALOG for $30) said to put a piece of masking tape on the disk, close the drive door with the tape hanging out, and when prompted, to pull on it (as it kept writing out that particular sector). High tech. The easiest (and safest) was to do it was to pop off the cover of the drive, find the speed adjustment screw, and to crank down the speed of the drive (to around 270RPM), write the sector, then bring the drive back up to speed.

Essentially (if I can remember my 810 schematics and operation), what happens is this: During normal operation, the write head is only activated for a very precise amount of time -- just long enough to write a particular sector. If it is turned on for any greater length of time, it will continue writing on the next sector(s). The trick to writing a bad sector was that when you slowed down (or sped up) the speed of the drive, the write operation occurred outside the olerances on the disk (either the sector wasn't long enough, or too long). For the most part, Atari drives couldn't handle illegal sectors, which is why you'd hear the head banging around as to tried to read the sector again.

> contain? Garbage? Unchanged? Zeroes?

The original form of copy protection on the Atari was the standard hard-error bad sector. That was one MAJOR difference between the Atari and the Apple II. The Apple disk controller was in the machine itself, and subject to complete software control. The Atari controller, on the other hand, was inside the drive. Because of this, only specified operations could be performed on the Atari, and thus modified disk formats were very difficult. That is, until the advent

of modified disk controllers, of which the Happy Drive was the first. Another one, called "The Chip" was a drop-in replacement for the Atari disk controller. The Happy drive was actually an additional logic board which provided even more capabilities than The Chip. It buffered reads by track, for example.

Duplicate sectors were fairly neat. What happened was two identical sector numbers would be written onto the disk, but with different data within the sector.. When the program called for a disk read on that sector number, one of those sectors would be read in -- but which one depended on where the disk head was currently located! So the test was (a simplified example) to read in sector 7, then sector 8 (the duplicate sector), then sector 10, then sector 8. Then compare the two reads from sector "8". If it was the original disk, you'd see different data.

Short sectors were fairly simple to check for as well. You'd initialize a 128-byte block of memory to a value (arbitrarily assume 0x55), then read in the known short sector. If all 128 bytes were altered, you'd know the short sector didn't exist. SIO would only copy the data it could read into RAM. If you just did a straight disk copy on a short-sectored disk, those sectors would (usually, depended on your copy program) read back zeros in the copy of the unused area on the original (i.e. if the sector on the original had only 50 bytes of data before the end-of-sector marker, and you make a sector-by-sector copy with SIO, the duplicate sector would have 128 bytes on it, and thus when that sector was read back in, the buffer you had allocated would change).

One of the more interesting programs I saw had a one-sector boot loader, which then loaded another loader sector by sector, XORing all of the data in each sector with an incrementing count and the sector number. Normally, just XORing the data with an incrementing count was standard, and this particular one was a tough one to figure out (it was self-modifying as well). But since every program HAD to have just one normal, executable sector (the boot sector), everything else could be derived. :-)

This reminds me; I never could figure out how the heck the data was
encrypted on Infocom adventure disks. Scott Adams adventures were a piece
of cake, since all the text was stored as straight ATASCII on the disk,
but Infocom employed some means of encryption. Was this, also, XORing
the data with an incrementing count? For fun, I used to swap data disks
in the middle of playing an Infocom game just to see what would happen.
Surprisingly, instead of getting garbage, I often got bits and pieces of
sentences and words. For instance, one time substituting the Zork II data
disk for the Zork III one, I got something like "xipuuwoier tpesoufpoer
gnomes." In case you don't know, Zork II had some rather amusing "gnomes"
appear if you somehow trapped yourself in an inescapable situation, but Zork
III didn't, so apparently the data is not only encrypted but also somehow
"blocked" into logical bits and pieces -- perhaps words, perhaps phrases.
I also tried modifying large chunks of data at random on the disk to
see what kind of garbage the program would spit out, and, again, it seemed
not to be totally random but rather random _groupings_ of apparently
preset determination.

Any information on this?

norlin@uokmax.ecn.uoknor.edu (Norman Lin) writes:

>This reminds me; I never could figure out how the heck the data was
>encrypted on Infocom adventure disks.

If the way Infocom data files are stored on PC disks is any indication, it's not so much an encryption as a compression. This is from memory, so it may not be entirely accurate, but bear with me.

The code used is 5 bits per "character". There was basically just one case of the alphabet, plus space and 5 "control codes", call them (just for example) A, B, C, D, and E, while the alphabet is lower case.

Most messages are encoded normally: If you cut the data up into the appropriate 5 bit chunks, you'll see things like

twisty passages

If a normal word needs to be capitalized, a control code is used for this:

Stuff is encoded as Estuff
Cyclops is encoded as Ecyclops

For additional compression, the other four control codes are used to encode macros:

the is encoded as (for example) Ac
up might be encoded as Bd

That sort of thing. This is one reason why you might get some sensible stuff mixed in with some nonsensical stuff, such as "xipuuwoier tpesoufpoer gnomes." Also, keywords (including the nouns and verbs) tend to be encoded either this way or some similar way. I never finished decoding all of the macros, as this required (i) making appropriate changes so as to find all of the macros while using the game's own decoder, and (ii) being able to find the situation you need to actually get it to spit the macros out at you. I mean, it's fun for a while, but there end up being over a hundred such macros, and even with a hard disk it's not a trivial amount of time just waiting for the game to start up, etc.

'ere you go,
Russell G. Brown

>Perhaps someone can answer these questions about Darek Mihocka's (Hope I got
>the spelling right...) 8-bit emulator Xformer?

John, I posted a long message to this topic a few weeks ago that will answer any other questions you may have about Xformer. Sorry I don't have a copy of it around, so if anyone has a copy, please forward it to John.
There are 3 versions of Xformer available: ST Xformer (for the ST and STE), TT Xformer (for the TT) and PC Xformer (for MS-DOS). The TT Xformer and PC Xformer have not been released yet. TT Xformer runs too slow for my liking, and PC Xformer is waiting for approval from Atari Corp since the original agreement was only valid for use on the ST.

> 1) What are the pinouts for the Xformer cable (to hook up the 8-bit's drive)?

The pinout and instructions are included in the Xformer manual. You can get a copy from me or from BRE software in California. (They have ads in magazines). Only supported in the ST version.

> 2) How does Xformer handle input from the joysticks? Are all 4 of the 8 bit's
> joysticks supported? Are only two? Do they plug into the ST's Mouse and
> joystick port? How about the "Paddles"?

2 joysticks, exactly like the 130XE and 800XL. No paddles. Not supported in the PC version.

> 3) How well does it do with disk based copy protected games? Does the
> "virtual floppy support" (files on hard disk) support disk based copy
> protection?

THe Xformer Cable will handle some, but not all, copy protected disks. Virtual floppy disks do not support copy protection unless you know of some way to transfer a copy protected disk over to the ST.

> 4) How fast is it compared to a normal 8-bit?

ST version: 40%-50% normal speed. TT version: 80%-90% normal speed.
PC version: 20%-500% (depending on the processor: 8088, 8086, 286, 386, 486).

> 5) Could someone post the source code for Xformer 2.55 to terminator (Darek
> said it's now PD and is on Genie, but I don't have an account there. Has
> it made it to Compu$erve, or anywhere else I can get it?

That source code is now old due to version 2.6. What do you really intend to do with it? I'm still waiting to hear back from the guy in Toronto who is porting it over to GFA Basic.

> 6) Has anyone tried M.U.L.E. or Seven Cities of Gold on it yet? If so, how
> did they work?

The copy protected versions do not work.

> light on exactly how it was done? I've always wanted to know.

If I remember (from long ago) Electronic Arts disk relied on a variety
of techniques for their protection. I beleive that timing was one of
them, but the disks were also heavily skewed; that is, data from various
sectors was originally "lined up" phyically on the disk, and the program
would check for this physical allignment. Therefore, and normal copy
program would transfer data but make no effort to maintain the physical
allignment. I installed a board in my 1050 called a 1050 Duplicator (or
some such) that cost about $150. It claimed that it would copy all EOA
disks without additional hardware or software modification. Three years
later and two hardware upgrades and four software versions later (all at
eatra cost) they finally announced that the new program would simply
patch Electronic Arts games. Strange to say, after three years of
rhetoric about the evils of copy protection, this patch program was, you
guessed it, copy protected, and the hardware-modified drive would not
copy it! Give me a break...

I bought vortex HDplus for my Atari ST4 before. I have some programs
for this kind of hard disk, but, I don't have vortext hard disk driver
programs (for example, VHDPLUS.PRG and HDPLUS.OVR). If anyone knows
where I can get it, please let me know. I would be very grateful.

Thanks in advance!

3724. Happy computers

Newsgroup: comp.sys.atari.8bit
Date: 1991-02-26 16:14:06 UTC
From: hajohnso@eos.ncsu.edu
Message-ID: <1991Feb26.161406.18396@ncsu.edu>
Source record: 114327

Does anyone have any idea what has become of Happy computers? I have a Happy 1050 and I'm looking for the source code to their software (the Warp Speed stuff) so I can code up some good hacks to access the weird areas of the disk that weren't meant to be touched by user hands (such as sector headers, sector order on each track, etc.). I called Happy a few years ago and they wouldn't tell me jack even though I was a registered user (and in fact had bought my Happy mod directly from them, not a dealer).

I would appreciate any information about the mod if anyone has hand-hacked their code (which I found a bit too time consuming to attempt) including what values I need to dump to the drive to get it to go into programming mode, what parameters I can download into the drive's RAM, etc. There are some neat things on the disk they supplied with version 7.0 but I suspect they were always holding back due to copyright laws or something.

Any help will be greatly appreciated.

Hi Michael,
Before you send your two computers back to Atari for service; I
would recommend that you call Atari by voice telephone first, and ask for a RMA
(Return Merchandise Authorization) number. This could save yourself a lot of
hassle. Call Atari at 408/745-2000 and ask for Customer Service. Bye.....

From: dam1@ra.MsState.Edu
Message-ID: <1109@ra.MsState.Edu>
Source record: 114329

Does anybody out there know what the latest (last?) version of the
SpartaDOS X cartridge is?...I have version 4.19 and I know there is
a 4.20...Is ICD still selling the upgrades?...if so, how much are they?

...while I'm on the subject of SpartaDOS...I have a utility that will
allow one to format, read and write an Atari/MyDOS diskette on an IBM
PC compatible...is there something like this for SpartaDOS disks?...
this is not terribly essential since SpartaDOS can read Atari/MyDOS disks,
but it would be more convenient...

I use Spartados, and I was using the correct format.
I had someone who owned a xf551 over here to check it out
and its the drive.
THe previous owner tinkered with it or something.
It wont do DD on either side.
I suspect upgrading the drive will solve it.

I believe that 4.20 is the latest and the last version.

But standard disclaimers apply. ;)

A couple of year ago you could get the software to make your Happy work
like an Archiever. The Archiever allows you to see what has been done
to the disk, and to modify it. You might try and get a Copy of that
software.

Atari Computer System for sale

All of this stuff is availiable to the best offer.
All equipment will be sold "as is" although everything except for the
things listed as inoperative worked the last time that I used them.

Pickup will be at Neoga, IL (between Mattoon and Effingham, IL on
Interstate 57; also about 70-80 miles south of Champaign, IL).
Otherwise I'll ship it to you (you pay for shipping).

Contact:

Todd Walk
RR 1 BOX 386
Neoga, IL 62447
217-895-3286 (best after 8pm)
walk@mrcnext.cso.uiuc.edu

Note on email: I don't check my email very often anymore, so you may have
to wait a few days for replies (but I prefer email).

Hardware

Atari 1020 printer w/pens,
Atari 410 cassette recorder,
Atari 400 (16K),
1 sets of paddles,
2 working Gemstick joysticks,
2 working Silkstik joysticks, 1 working Pointmaster joystick,
many non-working Atari joysticks

Books

Atari Basic Reference Guide, Basic Reference Manual,
Your Atari Computer, Compute!'s First, Second Books of Atari,

I was on ICD's BBS a month back or so, for the single reason that I wanted the latest version of the ATARIDOS.SYS driver. The file is free to anyone who wants to take the time to download it, but it is not freely distributable. If I remember correctly, ICD indicated that 4.21 *might* come out yet.

Reminds me of the time I tried to decode Alternate Reality (still my fave Atari game...anybody still into it?) The City way back in '84 or so. Aside from wanting to "crack" it to make a backup, I mainly wanted to cheat and get a looksy at the imbedded text blocks of the game. The copy protection started by looking for a flawed sector. Easy to take out. Then there was the loading and decrypting of a few sectors (load 'em, EOR each byte with some number and store the result somewhere, then jump and execute the resulting code). Cute, and again pretty easy. Then that resulting code used a chained decryption scheme on a bunch of other sectors (read a byte from disk, EOR it with some memory location, add something else to it, EOR it with something else, then store the result in a memory location based upon some formula, then execute the resulting code). This one was annoying, but do-able. This chunk of code then did the same sort of thing, but with a much more complex set of formulas to decrypt and lots of jumping back and forth between subroutines. What a mess. I gave up. Kinda strange that they'd go to such lengths to more or less annoy hackers and pirates (ie-rather than just go all out to start with, they start simple and draw you into each more complex level of protection).

BTW, did anyone out there ever "crack" this game and extract the text encrypted within sides 3 and 4 of the game? If so, I'd love to hear from ya...always wondered if there were more hidden things I hadn't discovered within the game...

-Ray

From: williams@fquest.fidonet.org
Message-ID: <uy02X1w162w@fquest.fidonet.org>
Source record: 114339

Could someone UUencode the P:R: connector handler?I have a friend who just got a 1200 baud modem for $15 and can't seem to use Bobterm(v.1.21)

It seems it accepts commands, dials, and everything else, except he can't see what he's typing(unless he goes into half duplex) and he can't see anything that's coming in through the modem(but he can see the receive data light flash on and off).When he types in command state, both the receive data and transmit date lights flash on and off.

We've tried setting all the dip switches(in particular, the echo on switch) and all the S registers.

Oh, one more thing, he can't see the OK sign after you type AT<cr>

Any ideas?

Jason Williams

I still play it every now and then. I was however disapointed when "the dungeon" came out..the graphics were horible and it seemed impossible to play..also..you couldn't return to the city..
I have a happy drive and when backing up disk 1 side 1..it showed you a bunch of wierd stuff.. tracks with 8 ,16, if think there was a 31 sector track or something. It could only e used on a happy drive since the drive programmed itself to do all the wierd stuff...and it was wierd!
have you booted side 2 of disk one?
I also tried manipulating my character..but never found the name..so i started trashing sectors ..but i never found it even that way and gave up.

There seem to be so Alternate Reality players on here, but did any of you ever try the Ultima series? I think I still have a text file describing what each byte on the disk mapped to (for Ultima III), that is, a character set; there was a byte to represent a lock, a guard, a wall, and each letter of the alphabet. It was fun to change HOTEL CALIFORNIA and other large text (16 x 16 bit) in Ultima II to other sayings. And of course to change the character attributes. When I purchased Ultima II, the game had a bug -- you couldn't find the blue tassles which allowed you to command a ship, so disk editing was mandatory.

>I gave up.

I have an Atari 800XL, and one major advantage of having an 800XL over a 400 or an 800 is the replacable O.S. One time I loaded in the Translator, thereby giving the old OS with the 4K section $C000-$CFFF free (since the old OS didn't use it). What's great is that now the NMI (non-maskable interrupt) vectors are in RAM, too. So I hooked into the NMI a routine to dump all memory to disk when I pressed a certain key combination. The routine itself was stored in the unused $C000-$CFFF region, known to be safe and free (much safer than, say, page 6!). Then, after doing this, I'd make a call to $E477 to reboot the computer then boot up a piece of software. After it loaded I'd replace it to disk and press the key combination to dump it all to disk. I had to save the PC (pushed onto the stack as with all interrupts) and all registers. What was tricky was how to load the thing back into memory; you had to restore the PC and the stack and all kinds of things like that that could quite easily disrupt the loader program itself.

Bottom line is, it worked for some simple non-graphics oriented stuff, but didn't work for any games. Reason? The hardware registers, the strange little region $D000-$DFFF. Many (most?) of these locations are not the same when you write to them as when you read them. (And of course since many commercial graphics-oriented programs do away with system VBIs, shadow registers are useless, too.) Thus, for instance, P/M graphics could be initialized, but by saving the contents of location $D01D I wasn't saving the state of the P/M enable port but rather getting the status of some totally different input port. I never found a solution to this so abandoned this project. As a matter of curiosity *is* there any way to totally save the current state of an Atari, including all the changes that have been made to the hardware registers?

Still, though, if you have an 800XL you can hook in some pretty neat NMI's into the O.S. that will let you, for instance, cheat on games. One that I once had constantly stored 0 into HITCLR (forgot the memory address, but that's the location that clears the registering of P/M collisions) unless you pressed a certain key or moved the second joystick or something similar, so that any game that involved P/M graphics would never register any collisions. Useful for getting to the end of some games.

Just more ramblings from an old hacker...

it should just go right on....need the righT connect but with SpartaDOS it should give you 720k per disk....but i
have an ATR 8000 for my atari....it will handle 5-1/4 in single/double sided or density...(will not do dual density tho') it will handle 3.5 drives in the same...
(720k max for a DS/DD 3.5 drive) if you or anyone is interested in buying send me some mail i will trade it for a 40 SCSI or ST-506 drive or $200...
(it includes everything to hook up a 3.5 720k drive and a 5-1/4 360k drive
EXCEPT power supply for the floppys...(standard +5,+12 but i do have the connector to hook the 3.5 to the standard power connector)...
you can run CP/M on the ATR i can give you the name and number of the guy who
has the software to run CP/M on it...it also has a print and Serial port (i have the cable to hook up a standard modem to it...(i am currently using it now wit
a Supra modem and Kermit (for the Atari) and have used DeTerm,Express,a term prg i wrote in Action! and several others...) it does have ONE bad side....size...
it is as wide as my 1200xl and 2 1/2 inches high and about foot deep....)

(p.s. you can hook it up to a terminal and use it alone to run CP/M....)
(it will support up to 4 drives of any config.....)

3742. BASIC renumbering program?

Newsgroup: comp.sys.atari.8bit
Date: 1991-03-01 04:45:09 UTC
From: dddean@bluemoon.uucp
Message-ID: <yP64X2w163w@bluemoon.uucp>
Source record: 114347

Hello :-)

Don't you just hate it when you are programing in ATARI BASIC, and you
have to insert something where it cannot go?

I DO!!!

That's why I'm looking for a program that would allow me to easily
renumber my program, and add space between areas that are crammed.

I have seen some renumbering programs, but they seem to do only that..
renumber. The one I'm looking for would also change the goto statements
to coorespond to the chaning of the line numbers.

EX:

BEFORE: 106 GOTO 106
AFTER: 110 GOTO 110
NOT: 110 GOTO 106

See my delema? It is good for the program to actually add more room, but
it is a pain-in-the-neck to have togo back and retrace my program to
re-align my GOTO/GOSUB/RESTORE statements...

Any help is appreciated!

I have a BUNCH of Atari 8-Bit software that I have gotten bored of, and would like to swap/sell some of it.

I took it to my local dealer, and all the offers were rip-offs!

SO: I have some here to list

All games here have the original packages/documentation

ACE of ACES SPY vs. SPY I,II,III

The Pawn M.U.L.E.

Gauntlet ONE-ON-ONE

Boulderdash/Super Video Title Shop

FaceMaker 221 B. Baker ST. (And Game Disks II/III)

PAINT Bruce Lee

I also have some software that I bought, missing the documentation. (Local dealer buys from customers that way)

Any interest should respond Via E-mail.

Yes, Is he using a hayes compatible modem? Or something that
ISNT fully hayes compatible. Also have you tried to load in a
different handler THEN load in bobterm?
Another suggestion would be to see if the copy you have of bobterm
is somehow flawed.

Got your EMaIl.. Heres why you are WRONG.
This is taken from the ATariwriter plus manual that you are asking
for, on page 1 (the inside cover).
"Reproduction of this document or any portion of its contents is not
allowed without the SPECIFIC written consent of atari corp."
Its unlawful for anyone to give this to you without ataris permission.
Id gladly copy up mine and send it to you otherwise.
Sorry dude.

There do exist a few different renumbering programs. I have seen
a couple binary routines that sit resident in RAM and catch RENUM
commands when typed at the keyboard. There is also one that you
ENTER into your program around line 30000. You then GOTO 30000 and
it renumbers the program and LISTs it to disk (or tape, if you are a
masochist.) I used to have these guys sitting around, and I might
still, but my 130XE is not functioning properly at the moment. But
there is hope. I think one or two of these things were Antic/ANALOG
creations.
You might also look into BASIC XE. It has a renumber command built
in. Turbo BASIC XL might as well, but I don't know. It is worth
looking into, but the later doesn't work with SpartaDOS (except for
SDX w/extended RAM).

I have an ATARI 800XL, and would like to resume programming on
it. I would be interested in purchasing a cartridgeof ACTION!
and a decent Basic that has a renumbering feature. I heard
that BASIC XL is reasonably compatible with ATARI BASIC and
supports RENUM. If there is anything around that could support
some more memory, I would be interested.

Please respond to my email address.

Thanks,

Mayer Goldberg

>re-align my GOTO/GOSUB/RESTORE statements...

Turbo BASIC XL has a renumber command:
RENUM {first line to change}, {start number}, {increment}

It renumbers all references. But watch out for computed GOTO's. A line like
100 GOTO 100+X*10
will be just partially renumbered by "RENUM 100,1000,5" to
1000 GOTO 1000+X*10

Turbo provides logical line number references, better flow control (like
REPEAT-UNTIL, IF-THEN-ELSE, etc...) and procedures (withOUT parms or local
vars :'-( ), more free memory and about 3 TIMES faster and is FREE on the
Atari archive or local BBS so you really should switch! (if you use a
non-XL/XE, get "frost" basic instead)

>I also tried manipulating my character but never found the name...

Yeah, I spent much time trying to alter my characters' attributes
as well. I did manage to "map out" the character disk after a bit
and find out that such and such a byte on sector x represented
how much food you had, etc. Problem was I couldn't edit it even after
finding it because the program used some sort of checksum and if
you messed with anything, your character either ended up dead or
diseased. About 2 years ago I did find a character cheater program
(one for the City, and one for the Dungeon) on a local BBS. Worked
great...alters all stats, lets you "transport" to any location
(including "secret" locations that the programmers locked you out
of by not making any doors into the area), adjust the time, etc.
The only thing I haven't found out about the game is how to decode
the text strings buried on the disks...

UN-SPRITES: Copy & Paste Graphics

by Jason Leigh

Sprites (Player/Missile Graphics) has always been the easiest method of animating objects on Atari computers. But what about computers like the Apple IIs and IBM PCs that do not have Sprites? They achieve animation by actually moving parts of the graphics screen. Although this is a less efficient method, it does have capabilities that Sprites does not; that is, they are not limited to the 8/255 resolution that Sprites has, and they can have as many colors as a graphics mode will allow. Un-sprites is a machine language program that will allow you to paste or copy windows to or from any of the 16 Atari graphics modes.

Setting Un-sprites Up

Type in Listing 1 using BASIC Editor II found elsewhere in this issue, and save it to disk or cassette. Executing this program will cause it to POKE the machine-language program directly into memory. For cassette users, append listing 1 to the end of your program that will use Un-sprites and call a GOSUB to load in the data. Disk users should save the data at address $6000 to $6300 using the "save binary" command in DOS.
Two demonstration programs have been included (Listing 2 and 3) to give you an idea of how Un-sprites can be used for animation. Listing 4 is the BASIC equivalent of Unsprites; the BASIC program should make it easier for you to understand the assembly listing.

Using Un-sprites in BASIC

Copying a window

The command in BASIC to copy a window is:

COPY=USR(24842,Screen Start, StartX, StartY, EndX, EndY, Buffer Address, Graphics Mode)

Screen Start is the address of the start of the screen memory. This can easily be computed by entering the desired graphics mode and reading memory locations $58 (88) and $59 (89). Here's an example:

```
10 GRAPHICS 7
20 SCRNSTART=PEEK(88)+PEEK(89)*256
```

You ae not limited to just that screen area; you may also specify a totally different memory address and copy a window from that by assigning the appropriate values for Screen Start.

StartX, StartY & EndX, EndY

These specify the boundaries of the copy window. Although there is no limit to the size of the window you can copy, it is advisable to keep the coordinates within the limits of the declared graphics mode.

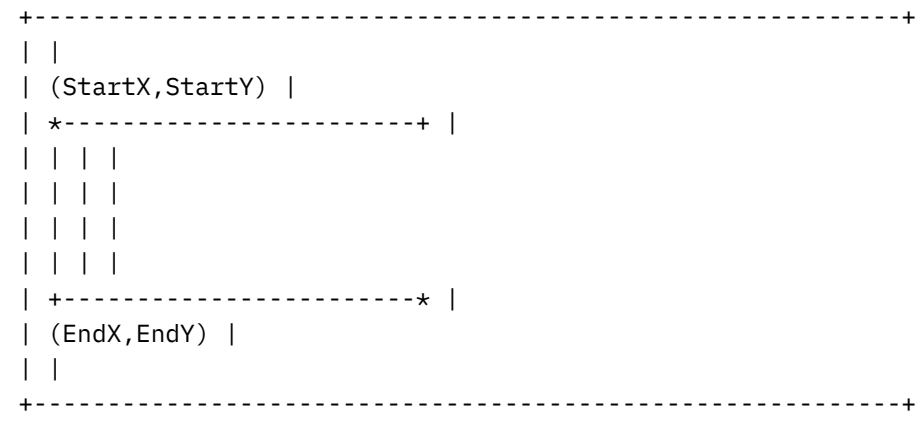

Figure 1

Buffer Address

The window you copy must be stored somewhere in memory, and so a storage buffer is needed. The advantage of having a user-definable buffer is that several windows can be copied, saved, pasted and repasted as needed by specifying the same buffer address. A buffer space can be declared at any address where nothing else occupies the memory. This can safely be done by dimensioning a relatively large string and using that as a buffer pool for many windows or just one window. The alternative is to dimension many little strings and store only one window in each of them.
The short program segment below dimensions a string 8K in size and assigns zeros to it. BUFFADRS holds the starting address of the string buffer.

```
10 DIM BUFFER$(8192)
20 BUFFADRS=ADR(BUFFER$)
30 BUFFER$(1)=" ":BUFFER$(8192)=" ":BUFFER$(2)=BUFFER$(1)
```

Graphics Mode

These correspond exactly to those of the XL and XE Ataris. Graphics modes 0 to 11 are the same for all 8-bit machines, but graphics modes 12 to 15 are defined as follows:

Graphics Mode 12: ANTIC Mode 4 (four color text mode 40/24)

Graphics Mode 13: ANTIC Mode 5 (four color text mode 40/12)

Graphics Mode 14: ANTIC Mode 12 (two color graphics mode 160/192)

Graphics Mode 15: ANTIC Mode 14 (four color graphics mode 160/192)

Pasting a Window

The command in BASIC to paste a window is:

PASTE=USR(25077,Screen Start, StartX, StartY, Buffer Address)

Screen Start is the address of the screen memory in which you wish to paste the window.
StartX, StartY specify the position to place the top-left corner of the window.
Buffer Address is the address of the buffer that holds data from a previously copied window.
It is assumed that you will past a window in the same graphics mode it was cut from. You may, however, choose to paste it in a different graphics mode; the effects can be quite interesting (or disasterous).
Warning: If you accidentally omit a parameter or put them in incorrect order, you could experience a serious lockup that will result in the loss of your program.

Explanation

Listing 4 is the BASIC equivalent of Unsprites. It would probably be a good idea to flip between the BASIC and assembly listings while reading the following explanation.

Copying

When start and end coordinates are specified, Un-sprites will find the closest byte that encloses those coordinates (See Figure 2).
DX holds the width of the window and DY, the height. Before the window is saved, these are used as headers in the buffer, as shown in Figure 3.
The number of bytes user per window can therefore be calculated as: (DX * DY).
After DX and DY have been calculated, the top-left memory (TLMEM) location of the window is computed. When all this is done, DX and DY will be saved to the buffer followed by the data in the window.

Pasting

Whereas Copy saved the entire byte that enclosed StartX and StartY, Paste allows exact alignment. Un-sprites will automatically shift the required number of bits to place the window at the exact StartX and StartY position. There are two methods of performing these shifts:

Method 1.

a. Calculate TLMEM
b. Find from the shift table, the number of shifts needed
c. Shift to the right

Byte a i{ shifted the required number of bits to the right. Shift Store 1 acts as a bit bucket that collects all the bits that have shifted out of a. The data in the shift store is then ORed with shifted byte b. But in order to shift b, a separate shift store (Shift Store 2) is needed. This method therefore requires two shift-storage registers that alternate in use, plus it needs registers to keep track of the address of the next byte. There isn't (at least not to me) an obvious way to alternate the use of two registers efficiently, so I came up with an alternative method.

Method 2. (figure 5)

a. Calculate TLMEM
b. Add 1 to TLMEM (TLMEM+1).
c. Find from shift table the number of shifts needed
d. Shift to the left

Instead of shifting to the right, we move to TLMEM+1 and shift the required number of bits to the left. This is much easier, as only one shift-storage register is needed; there is no intriguing alternation between two shift registers, as in method 1.

Calculating the Shift

The code needed to do this is:

Shift_Pointer = STX -(INT(STX/Pixels_Per_Byte)*Pixelx_Per_Byte)

With the shift pointer computed, the number of shifts is then found from SHFTABLE.
An example of calculating the shift is shown below:

Let Pixelx_Per_Byte (PPB) = 4 and STX = 9;

STX/PPB = 00001001 / 100 = 10 = 2 (all binary #'s);
then 2*4 = 8 and (STX-8) = (9-8) = 1

Look up 1 in SHFTABLE4 and we get 6. That means we need to do six left-shifts from byte to byte 1. (Figure 6)

Note: Two PPB graphics modes (GTIA modes 9, 10, 11) need four shifts per pixel, four PPB modes (Graphics Modes 3,5,7,15) need two shifts per pixel, eight PPB modes (Graphics Modes 4,6,8,14) need one shift and one PPB modes (the text modes) need no shifts.
That should be enough information for you to tailor the Unsprites assembly listing to your own needs. If $6000 is not a convenient location for this program, you could always move the start of the program to another location. The .OPT LIST command has been included so that it will always display the new location of COPY and PASTE routines.
Note that for larger windows that program could get rather slow, but if you are page flipping, the window canbe made to appear instantaneously by pasting on one screen while displaying another.
There are many applications for windowing: animating frames, editing graphics screens and manipulating GEM-like windows are just a few. Sprites and Un-sprites should be the complete pair that will allow you to perform the graphics manipulation you've always wanted on that Atari. Enjoy.

Saved Window
(StartX, StartY) \/
+----------+----------+----------+----------+----------+
/ | Enclosing| | | | |
| | Byte | | | | |
| | | | | | |
| +----------+----------+----------+----------+----------+
| | | | | | |
| | | | | | |

Figure 2.

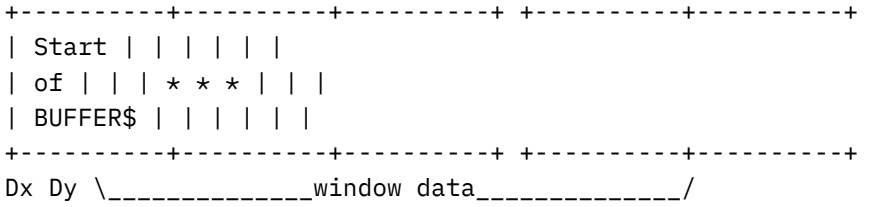

Figure 3.

Sorry, I haven't the patience to key in the other figures; you'll have to 'figure' them out on your own!

Source record: 114260

Hi There,

In my efforts to release an editor I made years ago, I need either

1) To read an Atari 1050 double-density (Atari DOS 3) disk in a PC-drive,

2) To have a DOS2 diskette, with the possibility to convert DOS3 to DOS2
(or vice versa).

I have MYDOS 4.5 (incl. 4.51 patches) on the PC, and a program "UTIL" which
read/writes MYDOS-disks in PC-drives, but have not yet succeded in creating a
bootable MYDOS disk. I've tried ATARIO too, but with similar problems. DOS3's
feature "Access DOS2" will not read any of the disks.

Does anyone out there have any suggestions ?

3756. MIDI on the ST - KWEST 16-bit Atari Meeting - Wed Mar 20/91

Newsgroup: comp.sys.atari.8bit
Date: 1991-03-04 17:20:39 UTC
From: daroloso@watmath.waterloo.edu
Message-ID: <1991Mar4.172039.24693@watmath.waterloo.edu>
Source record: 114259
Cross-posted to: ont.general,kw.general,uw.general,ont.micro,kw.micro,rec.music.synth,comp.music,comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.atari.st.tech,uw.sys.atari

The Kitchener-Waterloo Eight Sixteen Thirty-two (KWEST) Atari user group
will be devoting most of the March ST meeting to MIDI topics.
For this month only, we will be gathering on the
third Wednesday of the month (March 20th) instead of the usual
second Wednesday.

The MIDI presentation will cover the following:

- What is MIDI?

- MIDI music for the serious musician, and

- MIDI for the home computer user.

In other words there is something of interest for almost everyone.
There will be a MIDI freeware/shareware disk available, as well as
a number of pre-recorded tapes of electronic music for sale.
Our newsletter "The Hard Copy" will also contain several MIDI articles.

Our presentation starts at 7:30pm sharp, in room MC 2009 of
the Math and Computer Building at the University of Waterloo.
The door opens at 7:00pm.
Admission will be (a paltry) $2 for non-members, refundable
if you join our (humble) group.
Come early and make sure you get a seat...but make sure you
are on hand in time for the 7:30 start.

For further information, please contact Brian Bentley by
email at econadm5@watserv1.uwaterloo.ca, or by voice at 743-6455.

Hoping to see you on the 20th...

3760. 65C02?

Newsgroup: comp.sys.atari.8bit
Date: 1991-03-05 11:07:13 UTC
From: dh108@cs.city.ac.uk
Message-ID: <1991Mar5.110713.24023@cs.city.ac.uk>
Source record: 114270

I'm no computer engineer, but is it possible to just do
a straight replacement of the 6502 with a 65C02?

Just a thought.

Why not just dissassemble Elite ? Granted the code would be
uncommented... but you can't have everything, can you ?!!!

Jamie.

BART is on-line again. Make sure you read the help file and understand the limits that you are to work under. Ignorance is not an excuse.

I don't think it's possible to spoof the quota sysem "accidentally" anymore. If you are trying, it isn't that difficult, but be forewarned that when you're caught we'll notify your postmaster and post your name to the net.

Your quota is 400k or 5 files, which ever comes first. Your quota is restored after 24 hours of inactivity. If you are persistant enough, your quota will never get restored.

I need some help with hooking up multiple modems to an atari 8-bit. I was hoping to do something like Diversi-Dial (tm) for the Apple. I would need to hook up 5 or more modems if possible. The more the merrier. As far as speed, I probably would only need to handle 300 baud, maybe 1200 or more if the CPU could take the punishment of all that data. If anyone knows a relatively economical way of doing this, please let me know. Thanks!

if you know hardware hacking you could hookup a few 6552's to the system (read
charlie hughs multi-PIA upgrade and base it off that....if you are making your own software
then you could get two or three 800's link them thru joystick 3 and use 0-2 for a MPP/Supra
modems in the 1000e series (foud for $10-$20 each...)
this would be a good for 300 baud only tho'....another thing if you have a little
cash is find a multi-serial card that hooks to the SCSI interface and get a black box or a
MI/O (but you would need a company that would give the info for
interfacing for it)

I believe that some of the old MPP modems used to plug into the joystick ports. With an 800 and an 850 interface (with 3 (?) modem ports) that will give you a chance for 7. I believe I have seen ads for an Atari BBS to use multiple MPP's.

From: Robert_Lam@mindlink.UUCP
Message-ID: <5011@mindlink.UUCP>
Source record: 114280

Your message brings back a lot of fond memories of those days of hacking games. We did something like what you described, modifying the OS and dumping the memory out. But we've gone one step further and installed a small hardware add on that basically consisted of a ram chip mapped to the same address as the hardware registers. Each time the program writes to the hardware registers would at the same time write to the ram chip. It was then simple to find out how a program sets up the interrupts and P/M and such.

3769. Re: Multiple Modems

Source record: 114271

I should have mentioned that I have an 800xl with Rambo upgrade and a 1200xl.
The idea of hooking MPP modems to the joystick ports sounds good though.
Possibly I could do that with my present 800xl or pick up a cheap 800.
I would rather do this with just my 800xl and take use of the Rambo upgrade.
This would be a multi-line chat system only, so 300 baud would be acceptable.
Hardly any disk access that I can forsee. That would leave most of the time
to handle all that data streaming in from the modems. Any other ideas?
Thanks in advance!

Yes, I believe that this is usually possible. Note, however, that
the Atari 8-bits use a modified 6502, the 6502C. I think it does
something strange with interrupts to facilitate the use of gadgets
like the Antic chip. Therefore, I don't believe you can just pop a
65C02 into an Atari and have it work properly.

Message-ID: <1991Mar6.190420.20620@casbah.acns.nwu.edu>
Source record: 114275

Sorry, just thought I'd add my two cents worth... The striaght
drop-in replacement of the 6502 by a 65C02 would ALMOST SURELY not work.

It has a lot to do with the logic voltages of TTL compatable (6502
is an MOS device from Motorola and uses TTL compatable logic voltages), and
CMOS devices. The voltages for logic 0's and 1's differ between the two
chip technologies (CMOS has lower voltages). It is however interesting to
note that the 65C02 used in the 130xe series is FASTER than the standard
6502 running at 1.79MHz (incidentally, if you're wondering why 1.79MHz, it
is because it is an even factor of the TV color-burst frequency... 3.58MHz.
Makes video interfacing easier and it's cheaper to find a color-burst
crystal). Typically, CMOS is the slowest familly of Logic, so this must be
a variation, like HC (High Speed CMOS). While MOS technology is similar,
every MOS chip I've seen from Motorola is directly TTL compatable, and we
are taught to think of them in terms of a TTL type family of logic chips.

In this case, even if the 65C02 added an internal line-driver
(sometimes done to correct for the difference in logic voltages), often the
CMOS version has a different pin-out than the TTL version. Also, the 65C02
adds some new instructions to supplement the standard 6502 code to make
things a little faster.

To make a long story short, you are probably better off purchasing
a 130xe for cheap, than to fiddle with an old 800.

PS: I was a 800 user since 1980, then a 130xe user from 1985-1988. Now I am
a happy Mac II user. However, there's nothing like an Atari for easy
hardware interfacing. I wish I could show you the robot interface I once
built (at the cost of a fried 130xe!)

Hmmm... just a second, guys. Much as I hate to admit it, I owned an Apple //e a few years back (several). What do you think the enhancement kit for the //e involved? A couple new ROMs, and a 65C02 that was dropped in in place of the 6502. There are NO logic level problems whatsoever. The MAIN difference with the CMOSity of the 65C02 is that it used less power and ran cooler. Not like that was a big deal. There were the extra commands, too, as mentioned in a previous article.

Just try it and see what happens. Remember that there are some programs that relied on a bug in jumps on page boundaries with the original 6502. These programs may crash on a 65C02. This little bug was often used as a means of copy protection.

Yes, I believe it is relatively common to have a CMOS chip with TTL
conversions at the pins. That way you get the power savings while
maintaining compatability with the multitude of existing TTL logic chips.

> 65C02 into an Atari and have it work properly.

Unless you have a 400 or 800 with one of the old, old CPU boards, that is. Atari originally used the normal 6502, but soon moved some of the TTL logic onto the CPU chip (since they were having them custom produced anyways, I believe). If you compare an older and newer CPU board side by side, the difference is obvious... at least two less TTL chips on the newer ones, over on the side where the colour-clock delay trimmer is.

I swapped an older CPU card into my 400, and now I've got a 3MHz R65C02 in there. Running at only 1.79MHz, of course, but it stays nice and cool.

There are some minor disadvantages, basically because of the bug fixes. The JMP ($xxFF) bug is fixed, illegal instructions now map to either new instructions or NOPs (which can throw off some programs expecting nasty tricks to work), and I believe a few instructions execute a clock cycle quicker, which can throw off super-critical timing loops. The added instructions are quite nice, but since using them makes your code nontransportable, the thrill wears off quickly. There's not a lot of point to the upgrade, really.

> difficult to find, where can I mail order for this type of equipment/software

Ok many questions.
Here goes. You dont modify your computer to emulate a vt100, you do
it with software (kermit 65). To use a 2400 baud modem you
need to purchase an interface of some sort (850, p-r connection,mio)
to connect it (youll also need a modem cable.).
Your computer is 40 columns, but you can buy an XEp80 to turn it
into an 80 column machine. but you need a monitor as 80 cols
wont work on a tv set if thats what you use for a monitor.
As for a modem.. ANY BRAND You want as long as it works reliably.
You can order the modem from anywhere as long as its an external.
YOU can get the software from most atari 8 bit bbs, and you
can get the needed cable from ICD.
WHew!

yes it is....but one thing you have to remeber the xl's and xe's don't have a
6502 they have a 6502C which is different and therefore you can only put a 65C02
in a 800 (which i did about two years ago....) and theoretically you can also
put a 65C802 in...but i havn't been able to get it to work (it shows up with
the blue screen but doesn't poll for the drive....i was gonna re assem the OS
(friend has it) and put in my own roms but never got around to it...(16 bit
math routines....aahhhh the dreams of the young...)

Source record: 114283

Ooops, sorry, I guess I'm wrong. The 65C02 must have TTL line drivers installed. I dunno if it would make the computer faster however, since it is still clocked at the same clock speed, and the peripheral interfaces are still the same type (I think the XE series has upgraded PIAs). But, I would like to hear from those that modifed it. The key advantage to CMOS technology is that it requires very little power, but its drawbacks are speed and also driving devices. CMOS requires little power because in CMOS technology power is consumed only when switching between logical states (0-1 or 1-0 transitions). Very little power is used in the steady-state logic outputs. This can possibly be a problem, especially if there are pull-up or pull-down resistors somewhere, since it may not keep the correct logic values (Should not be a problem if line-driver is installed though).

If you decide to modify it, you MUST be careful to observe CMOS static handling procedures, as a static shock could fry the chip's oxide layers. Basically this means the best protection is to only handle the chip with something like a static wrist strap (available cheap from Radio Shack) to ground your body. I'd like to hear how it comes out!

Ok, here is the definitive answer on CPU replacements for the Atari 8-bit series....

400/800 - CPU can be switched with a 65C02, and 65802. Nothing else is needed.

1200xl, 1450xl, 600xl, 800xl, 130xe, XEGS - all require a special board to perform some multitasking stuff in order to replace the CPU. The only board (that I know of) that does this is the DataQue 65816 CPU upgrade.

The particular design (NMOS/CMOS) used in the chip makes no difference (except perhaps in power consumption, and that is negligible).

I use Kermit-65 and haven't ever noticed two lines missing, and the BS key
works as it is supposed too. Are you using a different type of Kermit?

Hello:

I currently in a on-going arguement about the game Ultima I.

This guy I know, owns an Apple IIgs, and I own an ATARI 800xl, and we are wondering where the game ULTIMA I got it's start.

He says that it was first created on the Apple, but I thought that I read that Lord British started out on an Atari.

The graphics in the game look as if they HAD come from the Atari, but hey... who can answer?

Thanks for any help!

David D. Dean, President "Living in a 3-D world."

Source record: 114290

Greetings:

I just got surprised last week by my x-wife who sent me my old 800XL and
Rana drive (less some cables and any documentation....) I haven't played
on anything less than my Sun4 at work in as much time, but feel excited
to have it back, and want to do stuff with it.

Here's my general question: What are the sources for Atari 8 bit stuff?
Can I pick up a magazine with all the ads in the back and get a good list?

I don't want to take up any more bandwidth than I need to, so replies should
probably be direct.

Dave; too bad about the bum disk. The
problem is the extensive protection
scheme used by Datasoft. It is one of
the most sofisticated on the market.
Unfortunately it means that it won't
work properly on some drives. You may
thank your local PIRATE network for
that. It just shows that someone has to
pay for the misconduct of others. Too
bad. I hope you get a new disk soon.
Alternate Reality is one of the most
addictive games I have ever played. It
is like no other. I have seen similar
games demoed on the ST. One of them is
called Firestaff. I would almost buy an
ST just to play that one. Good Luck.
Don Wyman.

Fm: DON WYMAN 72456,2717
To: Henry T. Colonna 74726,3216 (X)

As far as the booting disease (scurvy)
is concerned, make sure you have

several backup copies of your character so you can reboot. Keep one copy writeprotected so you don't use it. If you are diseased during the game, it is because you were scratched or wounded in some other way by an adversary. The most common are Giant Rats (Rabies), Slime (slime), and Mold (mold). You may also be poisoned by Imps, Nightstalkers and others. The way to tell is if you are in a battle with any of these creatures and they take hit points from you, you can be sure they infected you. Get thee to a Healer. Sometimes the effects of these diseases don't show up for a while. You can also use a cleanse potion (Clear, Acidic, Unsure), Heal All potion (white, salty, caution), or a Cure Poison (Amber, plain, caution) potion. Good Luck and good hunting. Don Wyman, level 12, 975,000 experience points.

To: ANDY

ANDY;I am answering your questions here so others may benefit from the exchange. Leave your messages here from now on, OK? The first Champion I encountered I was able to Trick as a first option. That's why I didn't know how tough he was. Since then I have just fought him as I would a Knight, no problem. There are 2 stores (shops) with the same name in 2 different areas of the city. It was a mistake so don't worry about that. There are only 12 guilds in the city, not 14. The other 2 are in the Arena area and will not be accesible until the Arena disk comes out. The Dungeon is due around Sept. There is NO WAY OUT of the 2 traps areas on my maps. This is another booboo in the game. It was unintentional according to Phil Price. Spend some of your money on fine clothes. I was told that what you wear

will have an effect in the Dungeon. If you are Inebriated (drunk) you must get to an Inn and sleep it off or a healer to remove alcohol. You can also use a cleanse potion. Good
Luck and happy hunting. Thanx for the offer, but I'll keep searching for my Flamesword. Don Wyman level 12 975,000 experience points.

Fm: Bill Damm 73247,3330
To: Don Wyman

One thing that I haven't seen anyone
mention yet is sleeping accomodations.
I'vefound that it doesn't pay to skimp
here. My character has recovered more
hit points more quickly sleeping in a
more expensive room. One question: do
you know the effects of PROTECTION +2
and how long it lasts? I've been able
to quaff acid with no untoward effect
since getting it, but I don't know what
else it does for me. Thanks for all the
help - I read AR messages here twice a
week. Hope this is useful to someone
out there.

Bill (GEORGE - LEVEL 6)

Fm: DON WYMAN 72456,2717
To: Bill Damm 73247,3330 (X)

Bill; Protection 1 and 2 are temporary
armour. I don't know if it has an
effect on acid or anything else. I

think that maybe Invul. water may have the effect you are mentioning. I agree with what you said about staying in better rooms to heal up. I stay in suites as a rule. Your Hit points do restore faster. One other thing that I have been doing is carrying 255 water and food. There are no ill effects such as fatigue from this practice. It is also much easier to build back up. You cannot carry more than 255 of each. I have done this in anticipation of the Dungeon. You will probably not have any Taverns down there. Fm: RICHARD POSTGATE 73017,1735
To: all

A few things... First of all, has anyone noticed that there are actually four types of music played for monsters? (There are two main types, plus two variations on each of the main types). Also, are there any rings to be

found in the city? I've found a good way to get a character going (up a few levels quickly when you start out). When you have some potions in your possesion, what kind they are is totally random. So if you save your character (then back it up), next time you load it the potions will be different. So you keep loading your character until one of the potions you're carrying turns out to be a treasure finding. Don Wyman- There is a large area SE of the arena that I can't find any way into to map...What does your map look like there? An addition (or correction) to the potion list in DL0; I drank a Black Sweet potion that turned out to be Invulnerability Blunt! Why do treasure finding potions say they last so long (the name below your food and water), and yet they only seem to work well for

a few hours, then don't really help
much any more? [Gray Mouser, lvl 7]

To: mark henry 76525,2150 (X)

The area SE of the Arena is closed to
you now. It is part of the Arena and
you will find the 2 "missing" guilds
there. The Black potions are somewhat
variable. I have had the same
experience. The Treasure Finding is
also a variable effect as to its
longevity and power. It seem that the
more "bad" you are the less you get
from it. There are no rings in the
City. I have heard that they are
associated with the guilds and will be
used in the Dungeon due in late Sept.

Jeff,
Believe me when I say that I no
longer run bad charatcters! I learned
the hard way. I once had a character
that had awesome Charm so I got to big
for my britches. Guards where falling
left and right Grog (that was his
name) showed no mercy. He was close to
Chaotic Evil if you ever played AD&D.
So now I run characters as good (Lawful
Good) people. They do much better in
the long run. I've found that, for me
anyway, evil types aren't even around
for the long run. Be seeing ya.

Jeff, I seem to have figured out as
much as you've told me. My biggest
problem is this-> example: I'm walking
down some street and have an encounter
with, say, a knight or something like
it. It automatically is in engaged
in combat. I hit-*-no effect. It hits
-<SKRUNCH>- Darkmoor's pushing up
daisies after receiving 9 or so hits.
What I'm looking for is a quick way to
get cash and/or a reasonable weapon
(not just a dagger). Any suggestions???

Dead again...
Floyd Walker

Floyd,
Until you're at a higher level
with some decent weapons and armor
I'd disengage most stronger life forms,
i.e. knights, swordsman, gladiator, and
the like, you'll lose some money and
treasure once in awhile put at least
you're alive. Have you tried going out
at night for a short time, thats when I
got almost all of my better weapons and
armor. Most of all just keep on trying.
I don't know how many times I had to
restart the game until I got a
character that was worth something.
Good luck,
Jeff

Good life forms leave when I ignore them if I'm not in a "treasure finding" mode. I got the 1st flamesword at lvl 10, I thin, and I just got another one at lvl 13. It does seem that the higher you're the better the weapons you get. I got both flamesword from a troll, while in a "treasure finding" mode, near the alpha omega healers.

Good hunting,
Jeff (jorel lvl 13)

Haallpp!! Does anyone know WHY, when I reach lvl. 4 or so, all the taverns seem to..well
it says "Entering..." on the screen, the disks whiz a while, then "Leaving.." comes up. I eventually get too weak to defend myself -POOF- no mo' adventurin' for Traalfonz. Would going to a healer either counter the effects of starvation or possibly, somehow, let me back in the taverns? If so, or even if not, please give me explicit directions to the nearest (and cheapest) healer.
Also, has anyone been to Lusty Loydd's yet? Got cheap food & drink.
OOH! I'M DYIN' AGAIN!

GET BACK TO FLOATING GATE. HEAD WEST TO
WESTERN GATE. TURN SOUTH AND GO TO
WALL THEN TURN WEST, GO TO WALL. TURN
NORTH AND GO TO WALL. TURN WEST. GO
WEST TO WALL, THERE SHOULD BE A
TWO-BLOCK WALL TO YOUR LEFT AS YOU GO.
TURN SOUTH. YOU SHOULD SEE A 3-BLOCK
WALL HEADING TO YOUR LEFT RUNNING NORTH
AND SOUTH(YOU ARE NEXT TO THE CITY WALL
BY THE CORNER OF THE WESTERN GATE).
THE NEAREST BLOCK ON THE WEST FACE OF
THE 3-BLOCK WALL IS A PASSAGE
PASS THRU EAST AND FOLLOW WALL AROUND
UNTILL YOU ARE FACING THREE DOORS TAKE
WEST DOOR. TAKE SOUTH DOOR AND
STRAIGHT SOUTH TO ALPHA-OMEGA HEALERS

THE ONLY OTHER HEALER IS BEHIND A
WALL TO THE NORTH-WEST OF CITY CENTER
WITHIN ABOUT 3 SQUARES OF THE SMITHIE
YOU CAN FIND IT IF YOU START FROM THE
WESTERN GATE AND GO NORTH TO FIRST
DOOR, THRU DOOR, KEEP WALL TO RIGHT, GO
NORTH TO SECOND DOOR, EAST THRU DOOR,
THEN HEAD SOUTH. KEEP WALL TO RIGHT
(AROUND ANY ATTACHED BLOCKS OR WALLS)
AND YOU WILL EVENTUALLY GET TO THE
HEALER. HOPE YOU MAKE-IT. STAN

Don, THanks for the help finding the taverns and the Assassin's Guild. I already had found the Thieve's Guild (don't know if i omitted it from my list or you missed it) but I am still missing one guild. From the artist conceptual drawing in the newsletter I am convinced that it has to be in the north-west quadrant. the guilds seem to be represented in the drawing as towers and they show up in the approximate location of the guilds that I have

found. I see two of these towers in the NW quadrant but can only find the Blue Wizards Guild in that quadrant Another thing that happened to me resently has me a bit confused . I came across a magical sword (my first

magical item in playing through nine levels) but my longsword still seems to do more damage, why is that??? I also ran into a ghost but could do no damage to it is there some sort of secret to killing ghosts???
I sort of feel guilty for leaning on you for all this info , hope i can return the favor later.

Thanks in advance,
William Rodawalt

FINALLY broke 10000 exp points, with nothing more than a dagger! HAHA (My sense of accomplishment is way up there...) BUT my character is Diseased, Hungry, Thirsty, and Poisoned with weak poison (that was MY fault) and I haven't even found a Healer! Where are they???
When you get up to those sky high levels, does it still give you 1 pt. of Str, Chr oops etc? Or do you get 76 str, 47 int, etc with potions??? (and guilds, of which I've only located 2...)
The toughest guy I fought was an assassin, gave me 4 pots and some gold,

did me no good cause I was completely lost! In other words, I NEED YOUR MAPS!!! I've tried, but...
I discovered something you may want to investigate, tho, it's in my message on the Gamers forum...

Do be kind to poor and blind, see well out beyond your eyes....
By the way, if you keep buying rounds of drinks at taverns, (like 5) when you're hungry/thirsty, they'll give you food FREE! HAAHAHAHA (Sorry, it's driving me CRAZY!) I'm gonna give up on that char. and start anew...

Now that you're gone, some will grieve on, on and on, I know you'll be back

again, maybe next time, will be the time, you WIN.....! (Let me know when ya get the dungeons...)

Sounds like you've got a bad case of AR fever. Too bad. Long hours and lots of frustration. I left a msg. about the maps on the Gamers Sig. Just leave me a msg. on Easy Plex and I will give you the info to order. You will probably get 1 str. pt. every 10,000 or so exp. sometimes you get a chr. or int. pt. When you go from 1 level to the next, most of your stats will go up. I now have 28 STA, 59 CHR, 210 STR, 57 INT, 28 WIS, and 28 SKL pts. with 192 hit pts. All started under 20. Don Wyman. (thorex level 13; 2,100,000 exp. pts.)

Try recopying all of your disks and cleaning your drives if necessary. I occasionally get scurvy when I restart a game after a lot of wear on the city disks, it always clears when I recopy the disks. Also, if you get started

with a good character, make several copies of the character (hit 's' to save as soon as you can) this gives you several chances to salvage a character with good stats but bad enough luck to meet Knights and Guards from the start...(I lost my first SAMWISE withh all stats above 18 before I learned this). The nearest healer is hidden about 8 blocks south of the western gate. good-luck Stan [Samwise level 11]

Congrats on reaching Lvl. 8! Just reached it myself about 3 or so days ago. A good tip for potions: When you get 3-5 pots., save your character, dup the char disk, reload char, and start by Unsealing then Quaff-ing the potion(s). If you get a bad potion, just re-copy the char disk and try again. Might take a while before you get a treasure finding potionor something almost as good.
Happy Hunting!

Fran; Go to the city square and turn
west. Go to the end of the street and
follow the path to the left (south).
When you get to the first long passage
heading south, bump the walls on your
left. The first wall should open. Look
around there and you will see 3 doors.
Face the center one and enter the one
to the left. Turn left and go straight.
This should take you to the AlphaOmega
Healers. Or take an Amber, Plain,
Caution potion for the poison and a

Clear, Acidic, Caution potion for the Disease. If you haven't already, look in the DL2 games area for my potions list. Yes there are other women players. Just don't run across them that often. Don Wyman Thorex level 13: 2,300,000 exp. pts.

3788. new commercial games for 8-bit

Newsgroup: comp.sys.atari.8bit
Date: 1991-03-12 00:03:39 UTC
From: wilmott@u2.rutgers.edu
Message-ID: <Mar.11.19.03.36.1991.3577@u2.rutgers.edu>
Source record: 114293

With the lack of any real software availability for the
'ole 8-bit these days, I just thought I'd pass along
some info about where you can actually buy NEW, COMMERCIAL
games for it here in the US.

1. Software Infinity, 642 East Waring Avenue,
State College, PA 16801.

Aside from their PD/Shareware disks, they've now started to
carry commercial games imported from West Germany (and
translated into english). So far, they've got about a dozen.
Write and ask for a free catalog.

2. Change In Heat, 12 Bella Vista Place, Iowa City IA 52245.

As far as I know they only have one 8-bit release so far.
It's basically 3 games on a ds disk and called Pondering
About Max's. Nice graphics, sound and packaging. Hard to
master. Write for pricing info.

I have nothing to do with either company...I'm just a fellow
8-bitter passing along some info. If anybody else knows of
any other mail-order (US *or* abroad) sources of NEW software
for the 8-bit, PLEASE let me know.

-Ray

Source record: 114294

I am intending on putting up an Atari 8-bit oriented BBS next semester.
I am interested in how many 8 bitters there are out there that would actually
call and keep the 8 bits alive. The BBS will be in the 814 area code. Of
course it will not be limited to the users of Atari 8-bits, but that will
be the focus of the BBS. Unless, of course, you users disagree, and if there
are enough 8 bitters out there, and feel that it would be better to run an
Atari 8-bit only BBS.
Any comments or information will be greatly appreciated. Thanx.

Archangel

3794. Help! My 1050 has stopped working...

Newsgroup: comp.sys.atari.8bit
Date: 1991-03-14 00:20:00 UTC
From: dcfs018@Antares.Concordia.CA
Message-ID: <824@antares.Concordia.CA>
Source record: 114297

Greetings.

My disk drive has suddenly refused to work. I don't need to explain how difficult it is to use a computer if you can't load DOS in order to load a debugger in order to check the serial port data...

Anyway, what happens is that the drive complains when it is ordered to read a sector (e.g. during bootup). All I get is an annoying noise, along with a message saying it can't boot (this repeats ad infinitum, or at least until I shut it off).

Power seems fine. The LEDs work, and the power supply voltage is 12V AC. The motor starts and the head moves when I apply power, as usual. I have cleaned the head and the guide rails, and checked the circuit board for obvious problems (they aren't any blown components). I changed the drive # selector to all four positions. If it is selected as drive 2,3, or 4, I get a timeout sound, and when I put it back as drive 1, I get the annoying sound (not the same as the timeout sound).

I get error 139 whenever I try reading from the drive (I get this value using Omnimon). If I turn off the drive, I get error 138 (timeout).

I don't think it's a bad connection between the drive and my computer because my old drive (which can't write properly...) works ok if I use the same serial cable.

I think I have 5 options:

1) Fix it myself (but I'd need the 1050 service manual and a source for parts)
2) Send the drive out for repairs (but where? and for how much?)
3) Put my 8-bit system in a closet and forget about it (not desirable)
4) Cook up some hardware to let me use an IBM PC drive (too involved)
5) Buy a new drive (not at this stage)

I'm hoping somebody out there has some suggestions.

Jean Goulet

There is a small photo sensor and tranmitter on the path the disk takes when you put the disk it. This is what went on my drive. the whole thing is built into a small plastic "u" shaped assembly. This is what went on my drive and gave me similar symptons that you are having. I don't know about the error codes though. You might want to find a way of checking this out. It cost me $55.00 a few years back to have someone change one of these on mine. Other than that my drive has lasted me a long time.

One other caution: I have dust covers on all my equipment and I make sure I put them back on after each use. The only thing that wore out was a keyboard on my 800XL. Hope you find your trouble and can get it repaired.

=>
Yes, it is out; I have one in my 130XE. As it is, I don't think it was
worth it. The main reason is that the clock speed is still stuck at 1.79Mhz.
I haven't kept up with things in the last year or so, but last I heard
DataQue was looking into the possibility of introducing a new video board
for the thing. The main problem with upping the clock speed is that it
tends to freak out the ANTIC chip. With a new video board, it may be possible
to disable ANTIC & switch to a higher speed. I have heard rumors of 65816
chips that will crank up to 20Mhz, but I believe the Turbo-816 65816 is
rated at 5Mhz (Though I understand it may manage, say, 8Mhz.) But then the
RAM will slow things down. Extended static RAM cards are available, and will
support (I believe) up to 2Meg of SRAM.

3798. Re: Help! My 1050 has stopped working...

Newsgroup: comp.sys.atari.8bit
Date: 1991-03-14 22:45:08 UTC
From: mwoodwar@eecs.wsu.edu
Message-ID: <1991Mar14.224508.18251@eecs.wsu.edu>
Source record: 114303

Annoying noise and refusal to boot sounds like a track zero sensor failure
to me. I got a new sensor from one of the Atari parts havens (Don't remember
any names right now...) It didn't cost more than $10 and was simple to put in.
The track zero sensor is located on top of the drive mechanism (if I remember
correctly) and is kind of C shaped. When the head is moved all the way to
the outside of the disk, there is a tab which goes into the C shaped sensor.
This is a common failure of the 1050, and I hadn't even diagnosed my drive
for sure, but ordered one anyway, it works fine. I think when I turned my
drive on, it would step forward about 1/8th of an inch. If I
kept turning it off and on until it reached the
end of it's travel (the center of the disk), then it would make a horrible
grinding noise and come back to the outiside of the disk. (I did this with
the disk drive disconnected from the computer). Usually when you turn the
drive on, if it is at track zero, it steps out 1/4 inch or so, and returns to
the sensor. If it is anywhere else on the disk, it just returns to track zero.

Any questions, mail to mwoodwar@yoda.eecs.wsu.edu
Matt Wodoward

It needs to be set to drive 1 in order to boot from it.

The SIO port could be bad but this is unlikely.

1, 2, 4, and 5 all equate to 5. 3 is a bad idea :)

I would suggest #5 - you should be able to get a cheap (<$150) XF551 or
even cheaper (<$100) 1050 pretty easily.

>
>I'm hoping somebody out there has some suggestions.

Only one...try a new boot disk, or several boot disks. Also, try swapping the drive mechs in your 1050's - this would eliminate the possibility of the SIO/1050 logic boards being at fault. (And who knows, you might get one perfect drive out of it.)

Yes it did. Pick up the current issue of START and look at the 8bit
section in there. I believe it has something on the 65816 this month.
If it doesn't, and you want the address for DataQue, I can dig that up
for you. However, the upgrade costs $130 or so. (and that assumes you
put it in yourself). It isn't cheap.

Hi DJ,
You asked about companies that still support the Atari 8-bit.
I just got a catalog in the mail I had not seen before, you may want to write
to them and request a catalog for yourself.

Sagamore Software
2104 Arapahoe Dr.
Lafayette, IN 47905

There was no telephone number listed. I hope this helps. Bye.....

Luis

Yes, I loved this, one of the first games I ever bought for my XE. It was written by a guy called Archer Maclean who, if my ailing memory serves me correctly, was an American living in the UK. He did write some other stuff afterwards but I don't have a clue what he's doing these days.

>RE: SYNAPSE

I don't think Encounter was actually a Synapse product - it was produced by a UK firm called Novagen which, initially at least, was a guy called Paul Woakes. It was licensed to Synapse in the US. He went on to write the game Mercenary, which was released on the 8-bit and almost every other machine under the sun. After that he wrote Damocles (Mercenary II) which is only available for bigger machines, like the ST and the Amiga. Damocles was the most recent product - it was released sometime last year. Quite impressive (solid 3D etc).

Well, he wrote International Karate (IK) (European title, don't remember
the title in USA - Championship Karate? - anyway, it was stopped in USA
because Data East(?) thought it was a bit too similar to one of their
licences), and IK+ (all 3 done on the C64 too), and is reported to be
working on a snooker(or whatever you call it, billiard?, pool?) game for
the ST and Amiga.
All this as far and correct as I know.

Suggestion: call a board called OUTER CITY limits.
Leave ken (sysop) some feedback. Im sure he can fix it or tell
you what can be done for it. He has most parts and manuals..
If he has time you maybe can persuade him to work on it via
mail and have it sent back to you. His rates are very reasonable.
I had him do 3 1050s for me and he does good work.

This piqued my interest and I contacted the author, whereupon he informed me he was rapidly flipping between display pages with a DLI on one line. This technique actually has been around at least since the early 80's when Compute! magazine published an article to get 10+ colors on the old CTIA chips (though it used a VBI instead of a DLI but the results are practically the same).

>RE: Dropzone anyone remember this game? it was basically a Defender-clone,

>I have heard today anywhere!

Yeah, this game did impress me so I disassembled parts of it. Actually the majority of the animation is... hold your breath... done with CHARACTERS. The whole field (except for the bottom landscape part) is an ANTIC mode 4 field. You'll notice that the main enemeies (the Nemesite and the other one that looks like the Nemesite except his eye goes the other way) are very small, so that redefining blocks of characters to move them finely presents no problem. If you look closely, you can notice that when two enemies overlap, they flicker as one set of block characters or another takes precedence. It was quite easy to "lift" the character set from the game and incorporate it into some neat demos... The Nmeye and the Blunder Storm, as well as your player, are P/M graphics.

Agreed. Encounter is one of the few 8 bit games (others include Rescue on Fractalus and The Eidolon, with their fractals) that, to this day, has still totally eluded my comprehension. HOW on Earth do they do those graphics, and so fast? I tried disassembling it but got hopelessly lost. I believe it is done in ANTIC mode D (graphics mode 7), and I suppose that since the figures are geometrically simple (diamonds, circles) and consist largely of white space on the interior with no detail, the graphics could be done in real time rather than having preset graphical shapes overlayed onto the screen. How is the perspective handled? How are collisions (i.e. missile hits) detected? Any programmers out there care to comment?

Hey!

I have some friends with 8-bits and there are some PD programs that
they wanted. They are:

Starlords
Any good Star Trek games
PD(?) SpeedCalc
The Atari 400/800 version of Turbo Basic
Cad 3-D
Dos 2.5+ (Has Ramdisk and different fonts, etc.)
G.O.S. (Graphic Operating System)
Wizard Adventure Creator
Script80 V2.0 Word Processor
Digital Editor (Desktop Publishing Prog. (?))

I believe all of the above are PD. Since I cannot find these
anywhere, it would be great if someone could uudecode them and
e-mail them to me.
Thanks.

Eric A. HOBBS!
eahsnsr@JUPITER.nmt.edu

3812. Re: 65C02?

>since it is still clocked at the same clock speed, and the peripheral
>interfaces are still the same type (I think the XE series has upgraded
>PIAs). But, I would like to hear from those that modifed it. The key
>
The 65C02 performed some instructions faster than the 6502. However, the
the flags are set correctly on decimal math mode on the 65C02 at the cost
of one addtional cycle. The speedup would not really be noticable IMHO.

Also, the 6502 was used on the 400 and 800, but the XL and XE machines used
the a chip called 6502C or Sally. In this chip, a few pins were changed
6502C 6502
Pin function pin function
36 READ/WRITE 36 N.C.
35 /HALT 35 N.C.
34 N.C. 34 READ/WRITE

the HALT pin on the 6502C stopped the CPU clock and tri-stated the address
bus inside the CPU, instead of it being done externally like the 400 and
800 did. Also, because of the way the CPU clock is halted, (the clock is
stretched during phase 0 of the clock at logic 0 level) the 65802 isn't
a drop in replacement fo the 6502 even on the 400 and 800 because the
65802 doesn't allow the CPU clock to be stretched low for more than
10 uS. ANTIC stretches the clock for more than that when doing video
memory accesses.
BTW, I don't know how the DataQue 65816 board works, so don't ask.

>advantage to CMOS technology is that it requires very little power, but its
>drawbacks are speed and also driving devices. CMOS requires little power
^^
Not anymore. This was true back when the RCA 4000 series CMOS chips
were made, but all the latest CPU's are done in CMOS at high
clock speeds. The 68030 clocks at 50Mhz now, the 68040 clocks at 25Mhz
with 33 and 50 planned (I think), and the 80486 runs at 33 Mhz, with
higher speeds planned (I think). Intel did talk about a one of a kind
100 Mhz 80486 that they got running in the lab. And here at HP, we
have RISC processors running at 50Mhz. As for fan out, depending
on the process, a CMOS output can drive several TTL loads, and LOTS
of CMOS loads.

Just my $0.02.

3813. Atari 8-bit System forsale

Newsgroup: comp.sys.atari.8bit
Date: 1991-03-18 18:44:23 UTC
From: bell@plains.NoDak.edu
Message-ID: <8990@plains.NoDak.edu>
Source record: 114116
Cross-posted to: comp.sys.atari.8bit,misc.forsale,misc.forsale.computers

I have the following Atari 8-bit computer equipment for sale:

Hardware:

Atari 800XL computer
Atari 400 computer
(2) Atari 1050 Disk Drives
Atari Graphics Tablet
Atari 1010 cassette recorder
Tech Sketch Light Pen
Gorilla Banana 50 cps dot matrix printer (parallel)
(it's low quality print and noisy, but compact and graphics capable)
All power supplies, cables, and interfaces to connect everything listed
including TV interfaces for both computers and the printer interface.

Software:

Cartridge:

AtariArtist drawing program for graphics tablet
AtariWriter word processor
Atari BASIC
Eastern Front (war game)
Choplifter
Galaxian

Disks:

Atari Proofreader (spelling checker for AtariWriter)
Graphics printer driver for above printer
AtariWriter printer driver for above printer
Micro Illustrator (basically an AtariArtist program for the light pen)
MenuWriter (creates menus for your disks)
Antic Disk Scanner
Antic Disk Utilities
Scanalyzer (disk examiner/modifier utility)
Atari Protection Techniques (goes with book, below)
Advanced Atari Protection Techniques (goes with book, below)
DOS 2.0
DOS 2.5
DOS 3.0
Castle Wolfenstein (game)
Beyond Castle Wolfenstein (game)
King Tut's Tomb and Tomb construction set by Antic
Typesetter (makes newsletters, etc)

Rubberstamp (graphic design program)
Megafont (program lister and graphics dumper)
Page Designer (incorporates above 3 programs)
Icons for above 4 programs
Antic Computer Challenges

Books:
Inside Atari BASIC (BASIC reference manual)
Atari Programmers Reference Guide
DOS Utilities
Atari Protection Techniques (with disk)
Advanced Atari Protection Techniques (with disk)
Your Atari 400/800 Computer Guide
Atari BASIC Tutorial

All equipment is in perfect working order and has only light use on it. The system has been in storage for 3 or 4 years (since I got my Laser 128). I have manuals for everything (hardware and programs), and all programs are originals. I have original boxes and packing for the disk drives and printer. This system cost almost $2000 when it was purchased (mid 1980s), and that was shopping around for the best deals on each piece. I am asking $500, and I will pay shipping in the 48 states for this price. However, I have been out of the Atari scene for quite a while, so I am willing to listen to whatever deals you may offer.

This system GOES AS A COMPLETE PACKAGE (the Atari 400 and 1010 could be sold separately or left out of the package).

e-mail to bell@plains.nodak.edu

p.s. - I posted this about 2 months ago and had some replies, but I have moved since then and lost access to those addresses, etc. Please respond again if still interested.

3814. REMINDER: MIDI on the ST - KWEST 16-bit Atari Meeting - Wed Mar 20/91

Newsgroup: comp.sys.atari.8bit
Date: 1991-03-18 21:35:50 UTC
From: daroloso@watmath.waterloo.edu
Message-ID: <1991Mar18.213550.21709@watmath.waterloo.edu>
Source record: 114117
Cross-posted to: kw.general,ont.general,uw.general,ont.micro,kw.micro,rec.music.synth,comp.music,comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.atari.st.tech,uw.sys.atari

The Kitchener-Waterloo Eight Sixteen Thirty-two (KWEST) Atari user group
will be devoting most of the March ST meeting to MIDI topics.
For this month only, we will be gathering on the
third Wednesday of the month (March 20th) instead of the usual
second Wednesday.

The MIDI presentation will cover the following:

- What is MIDI?

- MIDI music for the serious musician, and

- MIDI for the home computer user.

In other words there is something of interest for almost everyone.
There will be a MIDI freeware/shareware disk available, as well as
a number of pre-recorded tapes of electronic music for sale.
Our newsletter "The Hard Copy" will also contain several MIDI articles.

Our presentation starts at 7:30pm sharp, in room MC 2009 of
the Math and Computer Building at the University of Waterloo.
The door opens at 7:00pm.
Admission will be (a paltry) $2 for non-members, refundable
if you join our (humble) group.
Come early and make sure you get a seat...but make sure you
are on hand in time for the 7:30 start.

For further information, please contact Brian Bentley by
email at econadm5@watserv1.uwaterloo.ca, or by voice at 743-6455.

Hoping to see you on the 20th...

RE : Synapse

Does anyone know what happened to this company as they produced some great games like BLUE MAX, RAINBOW WALKER, NECROMANCER & ALLEY KAT.
I heard that they run out of money because they were doing a project for Atari and atari never paid them. In the UK thier software was sold under the Synsoft label because of a company in the UK called synapse which sold business software.

I have several other synapse games and would like to know what other games they have written.

Also does anyone know if Ozark softscape (I think) still produce software as I have MULE and SEVEN CITIES OF GOLD by them which are both brillant.

Paul.

I need help with a problem I have here. I am trying to use my atari to
connect to my computer mainframe at school. I am using bobterm.
The mainframe lists emulation of every single popular terminal
there is (that I am aware of anyways) but the thing is that
when i select vt100 and use bobterm, It wont work well.
Even worse than that, I cannot send function keys.
This system is driven by function keys.
I dont know what the ascii equivalent of these keys are.
The system i want to connect to is a CDC cyber running NOS VE.
IF anyone knows how to solve the problem, or if anyone has software
that will help, please email me ASAP!

I don't recall the name of the person who has recently posted a lot of UU-encoded software, but I would really like to hear from him via e-mail. I've been COMPLETELY UNABLE to successfully use any of the files resulting from downloading and UUdecoding his postings, but have not heard one peep of flak from anyone else here and am left to wonder if I'm the ONLY person having trouble. That would bother me because I've been downloading and UUdecoding files for YEARS and this fellow's postings are the ONLY ones I've EVER had consistent trouble with.

The programs posted by the person I am trying to reach include --

JANES.UUE - "Jane's Program"
EASY.UUE - "EASY.AMP -- ANTIC Music Processor file"
UNSPRIT1.UUE through UNSPRIT5.UUE
CAVELRDS.UUE - "Cave Lords" game

There may have been others, but this person should by now know who he is. Please write me, and tell me *EXACTLY* what you are doing to UUencode and upload your files. What software on what system to UUencode, transfer-files, post-to-the-Net.

I would also love to hear the same information from anyone who has SUCCESS-FULLY UUdecoded and used this fellow's files; I go to a lot of trouble to download these things, and it's extremely frustrating when they don't work!

Thanks in advance!

>The programs posted by the person I am trying to reach include --

> JANES.UUE - "Jane's Program"

I tried unsuccessfully to get this one running too...

> EASY.UUE - "EASY.AMP -- ANTIC Music Processor file"

Haven't seen this one.

> UNSPRIT1.UUE through UNSPRIT5.UUE

All the BASIC files are badly corrupted. Some of them cause the
computer to lock without hope of recovery.

> CAVELRDS.UUE - "Cave Lords" game

Haven't tried this one either.

I believe these files are corrupted at the FTP site itself and not
in UUEncoding...

Hi there y'all !
Does anybody remeber that great game named Wizard of Wor ?
Sure does anybody.
So can somone tell me if that company still exists or if there are still
copyright protections on that game.
I'm asking this because I'm planning to program a ST-version of it (which
is running now, but has got bad grafix and bad enemy movement still).
Anyone nowadays interested in that game ??

greetings , f.

I have a question about connecting a color monitor to an 800XL.

Has anyone used a NEC JC-1225MA Monitor with their 8-bit ?
Someone at work wants to sell this monitor to me and I want to
make sure it is compatible... He used it with his C64. It has
two VCR like plugs in the back (video in and video out)....
I know I would have to buy a 5pin to video cable... Are there
any other considerations I need to take into account ?
What would be a normal price to pay for a monitor like this ?

Thanks
cfleck

I've never seen this brand of monitor, but if it has 2 (and only 2) "VCR-like" (RCA-type) jacks in the back, and no other jacks, then those must be Video In and Audio In (assuming the monitor handles audio, maybe some don't!). One Video In jack means the monitor accepts NTSC composite video (assuming it's not a European PAL-input monitor - I've never seen such a beast). If there are actually three (RCA-type) jacks (or two RCAs and a mini-phone jack), or two sets of jacks (one triplet, one pair or less if audio is not separated), then they are probably Chroma, Luma, and Audio In (and the 2nd set would be composite). I have a Commodore 1802C monitor, which of course works with a C64. It has two video input modes: NTSC ("Regular Video") and what I call 'split chroma/luma' ("Commodore video"). I use it with my 130XE (and, when pressed, with my 800XL, when some programs balk at the OmniView chip in my XE).

The complications at the Atari end are: The 800 and 130XE (and possibly other 8-bit models except the 800XL) will output either NTSC composite video or split chroma/luma. (The same monitor jack has pins for both - just use different cables.) But the 800XL is missing the internal wiring for the chroma pin, so unless you modify it, you can only use composite video. That's no problem for most monitors usable with 8-bit machines, because NTSC composite video is a (US) standard 'Split chroma/luma' gives better resolution, though - enough for 80 columns (for me, anyway).

To summarize: Unless your friend's monitor ONLY accepts 'split chroma/luma' video - no composite video - you can use it with your 800XL. Composite video monitor cables are (or at least were when I last bought one) an off-the-shelf item.

The company that manufactured the arcade game was Williams. The company which marketed the 8-bit cart was Roklan. Williams is still around, but Roklan bit the dust some time ago. However, the copyright is still in effect.

>I'm asking this because I'm planning to program a ST-version of it (which

You could probably release the game with another name and have no problems. There are certainly tons of clone games around (Pac-Man clones come into mind). Just change the game in some slight way so it isn't an exact duplicate of the original. Let me know when you finish it! I'm certainly interested.

I don't know what happened to Synapse, but I'm sure they are no longer in
business. I haven't seen their name for years. As to MULE, Seven Cities
of Gold and many others, they are done here in the States by Electronic
Arts. EA is very much alive (last I heard anyway) and most of their
items are still available. They have dropped (all?) support for the
Atari 8bit though, so you will only find software for us through some
of the companies that advertize in American Atari magazines, such as
STart. Best, American TechnaVision and B&C Computers come to mind as
the best bet here in the US.

^^^^^^^^^^^^^^^^

Actually, the original poster was correct, and Ozark SoftScape programmed the two games mentioned (M.U.L.E. and Seven Cities of Gold). EA marketed and handled the distribution of these games.

One of my friends, (from Little Rock, AR, where the authors are from) knew the developers and he says they are still around. What they are doing now is a mystery to him, though.

Cavelords is a German program; most of the rest were from A.N.A.L.O.G.
I am working on getting a working copy up. I wish somebody had sent me
e-mail earlier about this.
BTW I think the copy of Cavelords on atari.archive.umich.edu was bad.
I'm not sure what I am doing wrong in uploading, I have both ends set for
binary transmission.

3829. Atari 8-bit System for sale (Repost)

Newsgroup: comp.sys.atari.8bit
Date: 1991-03-24 21:14:10 UTC
From: bell@plains.NoDak.edu
Message-ID: <9129@plains.NoDak.edu>
Source record: 114133
Cross-posted to: comp.sys.atari.8bit,misc.forsale,misc.forsale.computers

I have the following Atari 8-bit computer equipment for sale:

Hardware:

Atari 800XL computer
Atari 400 computer
(2) Atari 1050 Disk Drives
Atari Graphics Tablet
Atari 1010 cassette recorder
Tech Sketch Light Pen
Gorilla Banana 50 cps dot matrix printer (parallel)
(it's low quality print and noisy, but compact and graphics capable)
All power supplies, cables, and interfaces to connect everything listed
including TV interfaces for both computers and the printer interface.

Software:

Cartridge:

AtariArtist drawing program for graphics tablet
AtariWriter word processor
Atari BASIC
Eastern Front (war game)
Choplifter
Galaxian

Disks:

Atari Proofreader (spelling checker for AtariWriter)
Graphics printer driver for above printer
AtariWriter printer driver for above printer
Micro Illustrator (basically an AtariArtist program for the light pen)
MenuWriter (creates menus for your disks)
Antic Disk Scanner
Antic Disk Utilities
Scanalyzer (disk examiner/modifier utility)
Atari Protection Techniques (goes with book, below)
Advanced Atari Protection Techniques (goes with book, below)
DOS 2.0
DOS 2.5
DOS 3.0
Castle Wolfenstein (game)
Beyond Castle Wolfenstein (game)
King Tut's Tomb and Tomb construction set by Antic
Typesetter (makes newsletters, etc)

Rubberstamp (graphic design program)
Megafont (program lister and graphics dumper)
Page Designer (incorporates above 3 programs)
Icons for above 4 programs
Antic Computer Challenges

Books:
Inside Atari BASIC (BASIC reference manual)
Atari Programmers Reference Guide
DOS Utilities
Atari Protection Techniques (with disk)
Advanced Atari Protection Techniques (with disk)
Your Atari 400/800 Computer Guide
Atari BASIC Tutorial

All equipment is in perfect working order and has only light use on it. The system has been in storage for 3 or 4 years (since I got my Laser 128). I have manuals for everything (hardware and programs), and all programs are originals. I have original boxes and packing for the disk drives and printer. This system cost almost $2000 when it was purchased (mid 1980s), and that was shopping around for the best deals on each piece. I am asking $500, and I will pay shipping in the 48 states for this price. However, I have been out of the Atari scene for quite a while, so I am willing to listen to whatever deals you may offer.

This system GOES AS A COMPLETE PACKAGE (the Atari 400 and 1010 could be sold separately or left out of the package).

e-mail to bell@plains.nodak.edu

p.s. - I posted this about 2 months ago and had some replies, but I have moved since then and lost access to those addresses, etc. Please respond again if still interested.

3830. Vt-10 Squared, and The newest XEP80 compatable Kermit-65

3833. Homemade MIDI Interface -- Part 1 of 2

Newsgroup: comp.sys.atari.8bit
Date: 1991-03-28 02:51:18 UTC
From: terpin@acsu.buffalo.edu
Message-ID: <67653@eerie.acsu.Buffalo.EDU>
Source record: 114137

```
Homemade MIDI interface for the Atari 8-Bit
-------------------------------------------
Parts List:
1 7404 TTL Hex Inverter OR 7400 NAND gate
2 220 ohm resistors (10%)
1 Atari serial port plug for your computer
2 5-pin Midi plugs (RCA) for your midi keyboard
1 breadboard/experimenter perf board
1 project case
approx. 10 ft. of 3 wire cable
twist ties to tie down wires etc..

The serial port pins as seen on the computer are:

2 4 6 8 10 12
o o o o o o
o o o o o o o
1 3 5 7 9 11 13

1 - Clock In 7 - Command
2 - Clock Out 8 - Motor Control
3 - Data In 9 - Proceed
4 - Ground 10 - +5V
5 - Data Out 11 - Audio In
6 - Ground 12 - +12V 13 - Interrupt

For this project, we will only need to use pin #'s 3,4,5, and 10 of the
serial port.
---------------
(CRUDE) Ground (pin 4)
SCHEMATIC: 7404 |
|\ |\ 2|
| \ | \ 220 ohm 5 o 4
data out ---| O--| O---\/\/\/---------o o---/\/\/\/-- +5 (pin 10)
from computer | / | / 3 o o 1
(pin 5) |/ |/ MIDI OUTPUT cable to synth

2
5 o 4
Ground---o o------------(optoisolator)------- data in to computer
3 o o 1 (pin 3)
MIDI INPUT cable
from synth

Pins 1,3 of the Midi Output cable and pins 1,2,3 of the Midi Input
cable are not connected.
```

The optoisolator is optional, although it is recommended for extra
protection for your midi keyboard. I have used the interface
hard wired without the optoisolator without any problems (so far).

Also note: the normal serial i/o to the disk will sometimes interfere
with the midi interface and vice versa. This sometimes results in
a note sounding on the synth when loading or saving a file, or the
disk will glitch if you try playing the keyboard during disk i/o.
One possible way to remedy this annoying problem is to replace
the 7404 with a tri-state buffer which can be turned to a high-Z state
using the motor control (pin 8) from the serial port.

Anyway, BE CAREFUL and check all your wiring before you hook the
interface up to the synthesizer.

Please let me know if you have any suggestions for improving the
interface.

3836. Re: Homemade MIDI Interface -- Part 2 of 2

Newsgroup: comp.sys.atari.8bit
Date: 1991-03-28 22:07:35 UTC
From: rlcollins@miavx1.acs.muohio.edu
Message-ID: <4484.27f222d7@miavx1.acs.muohio.edu>
Source record: 114140

After seeing the diagram for the MIDI interface I was wondering. How hard would it be to hook it up to an ST through the MIDI ports, and be abel to transfer data back and for? (Or even to use the ST as a pseudo disk drive for the Atari. I'd be willing to write the software for the ST, hopefully writing it as a DA so you can be using both your ST and your 8-bit at the same time.)

Any thoughts or ideas?

Well, you have to connect your Atari to the computer that has the info
on it. This means use a terminal program and dial up the modem that
is connected to the big computer. If the computer doesn't have a modem
that you can use, you are SOL.
Ok, once you've managed to get the files into your Atari, you need to
uuDEcode them. UuENcode turns a binary file into a text file, DEcode
does the reverse. There is a basic uuDEcoder available (sorry, I don't
have it nearby) which is listed and has no special codes in it. This
basic listing can be ENTERed right into basic and run. Once you have
the basic DEcode working, you can FTP for the binary decoder (which works
a lot faster) and decode it.

You need to use a downloading program to download it from your
host. Try the commands:

kermit, xmodem xm sz sb sx or such...or try to get man pages on them...

in any case your host should have a downloading program so ask your
sysprog what is availble there.

also YOU need to have a downloading prog....probably yer terminal emulater
has one....XMODEM is everywhere...zmodem or kermit are out there too
for the 8 bits...

If you ftp from umich, you can get the basic uuDEcoder from there also.
This would be an easy ascii capture or ascii download once you get it to
your school macine.

Source record: 114152

I have just recently picked up an Atari 800XL and a Rana Systems 1000 drive.
My problem is that there were no cables included, or power supplies for either
machine. This makes using them very difficult :-)

I believe I can track down a power supply for the XL without too much trouble,
but I have had no luck at all with a supply for the disk drive.

Main Question: Could anyone offer some helpful information regarding the
power requirements for this disk drive? Where I might get one,
Possible compatibility with other power supplies, Anything that
might help!

Another One : I also own a C64, and I've noticed that the computer-end of the
power supply (a DIN jack) looks identical to that of the
Atari 800XL. Does anyone know if power supplies for these two
computers are identical (i.e. swappable/interchangable)?
I'm curious, but not brave (or stupid?) enough to test it out
blindly |-)

> |||| Power Without How DO you move/copy a rc1dsanu@miamiu.BITNET
> / || \ The Price!! Subdirectory? R.COLLINS1 on GEnie
>---
It would probably be fairly easy. In fact, I originally used my interface as an RS232 link to my IBM-PC to transfer data at 19200 baud. The 8bit software for this Null modem was virtually identical to the MIDI source code. The only differences were that it didn't insert the VBI timing marks during input ("recording") and the values for AUDF3 and AUDF4 were different. (I've seen a formula that relates AUDF3,AUDF4 to baud rate-- I believe it's in the Operating System listing.)

The V: handler I wrote for the MIDI interface will work fine for SENDING data TO the ST: i.e. here's a basic 8bit program to transfer a file from your 8bit to your ST through the interface:

```
5 REM make sure D:MIDI.OBJ has been loaded
10 DIM FILE$(20)
20 PRINT "Enter filename to send";:INPUT FILE$
30 CLOSE #1: OPEN #1,4,0,FILE$
40 I=USR(39158,ASC("I")) : REM initialize handler
50 CLOSE #2: OPEN #2,8,0,"V:"
60 TRAP 80
70 GET #1,A:PUT #2,A:GOTO 70
80 CLOSE #1:CLOSE #2
```

The ST program would dump its MIDI data to some buffer. Unfortunately, I don't own an ST (which is what motivated me to build a MIDI in the first place :)), so I have no idea how to access the MIDI port through the ST.

The V: handler as I have written it, however, doesn't work very well for input nor does it use the normal SIO protocol. The source code would have to be modified by disabling the VBI timer routine in the

RECORD section of the source. Using the new object code, the 8bit receive program goes something like this:

```
5 REM make sure modified MIDI.OBJ is loaded in.
10 DIM DATA$(20000) :REM buffer for received data
20 DIM FILE$(20)
30 DATA$(1)=CHR$(0):DATA$(20000)=CHR$(0):DATA$(2)=DATA$
40 I=USR(39158, ASC("I"): REM init V: handler
50 CLOSE #1:OPEN #1,4,0,"K:"
60 PRINT "Hit any key to start receiving":GET #1,K
65 REM ST starts transmission here.
70 I=USR(39158, ASC("R"), ADR(DATA$)): POKE 204,1
80 PRINT "Hit any key to stop receiving": GET #1,K:POKE 204,0
90 PRINT "Filename to save data to?":INPUT FILE$
100 CLOSE #2:OPEN #2,8,0,FILE$
110 ?#2;DATA$;
120 CLOSE #2
```

To load in the object code you can use one of 2 methods:

```
1) POKE 106,153:GR.0:DOS & load binary file MIDI.OBJ
2) POKE 106,153:GR.0:XIO 41,#1,0,0,"D:MIDI.OBJ"
```

The POKE is necessary to move the HIMEM page value down so that the screen data and the program don't overlap.

Hope this helps.

Don't know the pinout of the C-64, but the 800XL connector supplies +5V
and ground. If you open your 800XL, it is fairly easy to determine which
pins go to ground and which to +5V. Of course, you can just buy an XL
power supply from B&C Computervisions. Last I saw, they were $25.00.

PRESS RELEASE

APRIL 2, 1991

On Saturday, April 27, 1991, Bob Brodie, Manager of User Group Services for ATARI will be visiting Southern California. Bob is a very dynamic speaker. Before Bob came to ATARI, he was a User Group President. He knows what it is like in the trenches.

This visit is being sponsored by the User Group, H.A.C.K.S., but attendance is open to all ATARI Clubs and ATARI owners. H.A.C.K.S. has rented a 325 seat theatre for the occasion. This meeting will be held at the Glendale Public Library's Main Branch Theatre, upstairs. The meeting will start promptly at 10:30 AM and is expected to last three hours. The Library's address is 222 East Harvard Street, Glendale, CA.

Take I-5 to the Colorado exit, go East a mile to Louise Street, turn North, go one block. An alternative route is to take the 134 FWY to the Central exit, go South a mile to Harvard street, turn East, go two blocks. For more specific directions refer to the L.A. County Thomas Bros. Guide, Page 25-E5.

Best of all, admission is FREE, but it is on a first come, first serve basis only.

As an added bonus The Computer Network, a local ATARI Computer Store, will be having an Open House in honor of Bob Brodie's visit. The store plans to have many developers, including, but not limited to, CodeHead Software, Gadget's by Small and WuzTEK, displaying their products. Store manager, Mark Krynsky, says to, "...expect special prices and deals galore."

The Computer Network is located at 1605 West Glenoaks Boulevard,

Glendale, CA. The Open House will be from 2:00 PM to 7:00 PM,

after Bob Brodie's lecture is over. If you have specific

questions about the Open House you may call Mark at 818-500-3900.

Remember, Bob Brodie's meeting will start promptly at 10:30 AM,

at the Library and the Open House will start at 2:00 PM, at the

computer store. Directions from the Library to the Store will be

available at the Library.

I thought this press release would be of interest to most Atari
users here in California. Bye.....

Luis

DO NOT DO THIS! The C64 power supply generates more than +5v and GND, it also
generates 9 or 12v and will fry your computer quite nicely.

I use OmniCom to xfer files. A lot of files. I mostly use Xmodem, but
have also used Kermit. Both work OK, except that there is an apparent
bug in the Xmodem D(ownload) routine. When downloading to my XE, I
have to press <CTRL>F after the download is done and I have Q(uit)
back to terminal (communication) mode. I figured this out because I
first did most of my downloading from Delphi, and it would just sit
there until I hit <CTRL>C, then it would say "..Status: Final ACK
missing." Well, I thought, maybe I can supply that ACK. A look in
an ASCII table or two showed that ACK was <CTRL>F. It works!

There is no such problem when uploading (OmniCom responds to the
remote host's final ACK just fine).

Atari published "Technical Reference Notes" for the 400/800 which included

"Operating System User's Manual"
"Operating System Source Listing" and
"Hardware Manual"

This is probably the best place to look.
The serial number for the Tech Ref Notes is (was?) C016555.

Another good source of information is "De Re Atari" written by Chris Crawford
(author of "Eastern Front 1941"), though I don't remember the publisher.

Hope this helps...

S. Hunt.

3860. Bit wise operations.

Folks,

Anyone know how to preform bit wise operations on the Atari.
I have an Atari 800xl, and have developed a simple player
missle graphics game. The problem is that I have two players
that fire missles, but when I move the missles up/down in
memory I zap one of the players missle bit map because they
share memory bytes. What I would like to do is mask out the
bits that apply to a specific player. Also, all this is being
done in basic, any ideas? Another question, in Atari basic
how are HEX numbers represented?

Thanks in advance.

Well, first off, cartridge BASIC is poorly suited for writing PM graphics and games. The lack of bitwise operations, no interrupt handling, no fast memory moves, slowness in general... it all conspires to make it just about impossible. You should take a look at alternative languages. If not straight assembly, perhaps mixing assembly routines with your BASIC. OSS's BASIC A+, BASIC XE or Turbo BASIC all have some support for this sort of thing. Action! would be even better.

But if you're a masochist, bitwise operations can be simulated. The following code chunk isn't optimum, being off the top of my head... but it should give you the general idea.

Consider a missile stripe starting at the addr MISS, containing all four missiles. The addr MISS+Y contains the data for that Y pos.

```
7 6 5 4 3 2 1 0
m3 m2 m1 m0
```

To convert from byte to missile data bit pairs, try this:

```
BYTE = PEEK(MISS+Y)
M3 = INT(BYTE / 64)
BYTE = BYTE - M3 * 64
M2 = INT(BYTE / 16)
BYTE = BYTE - M2 * 16
M1 = INT(BYTE / 4)
M0 = BYTE - M1 * 4
```

To put the pairs back together:

```
BYTE = M0 + 4*M1 + 16*M2 + 64*M3
POKE MISS+Y, BYTE
```

> Another question, in Atari basic how are HEX numbers represented?

Decimal is all you get. Actually, cartridge basic knows nothing but floating point, but you can ignore that. If you want to work with HEX, you'll have to

supply your own conversions. Hex numbers can be kept around in strings, but it's easier to let the computer use what it's happy with and save the HEX for input/output with the human.

Hex conversions are much like the missile example above. Here's a bit of code I use a lot, again from memory (so it might need some debugging :)

```
DIM H$(16):H$="0123456789ABCDEF"
HEX = your number to display
GOSUB hex_print

hex_print:
K=4096
FOR Q=0 TO 3
H = INT(HEX/K)
HEX = HEX - H * K
K = K / 16
? H$(H+1,H+1);
NEXT Q
RETURN
```

To print 2-digit values (bytes) instead of 4 digits (words), change the loop to 2 iterations and K = 16.

Actually, both ANTIC mode 2 (graphics 0) and ANTIC mode F (graphics 40, fullscreen gr 8) use 320x192 pixels. The difference isn't really in the OS, though. The OS's responsibility is to set up the screen, and it handles screen operations via S: and E: devices. However, the OS has no support at all for text in a graphics mode, so any text in mode F has to be written to screen ram by the application. Not that it matters... the speed difference has nothing to do with the OS. The problem is in ANTIC, and what you expect it to do.

In text modes, ANTIC fetches a single byte from screen ram. This is the character to be displayed. ANTIC then goes off and fetches 8 more bytes of character set data, all by itself, during DMA transfer. As far as the program is concerned, a graphics 0 screen is made up of 960 bytes of data. A graphics 40 screen consists of 7680 bytes of data, because there is no character set lookup. It doesn't matter much to ANTIC, but it sure makes a big difference to the poor application that wants to move stuff around. If the OS supported text in graphics 40, it would be the same problem... far more screen memory to deal with.

The biggest speed killer is scrolling. Imagine a 80-col terminal at 9600 baud. Every time it gets a LF at the bottom of the screen, it has to move 7360 bytes and clear 320 bytes. If the LF's come consecutively, that means it's expected to move all that ram at up to 960 times a second. The Atari just ain't up to it. Hopefully, the scrolling won't be that demanding, and the Atari can buffer the input and catch up as soon as some regular text or terminal codes come by. Long strings of LF's can cause buffer overflow, and the the software gags.

There is a well-known technique to speed the scrolling up, taking advantage of ANTIC's smarts. Instead of blindly moving all that screen ram around, the 80-col emulator constructs a custom display list. When it's time to scroll, it moves the DL pointers instead of the actual ram. Now it has 320 bytes to clear and 48 bytes to calculate, which is much easier to accomplish. I wrote an 80-column ADDS ViewPoint emulator a few years ago that did this, and it could keep up to 2400 baud without difficulty. Never had an opportunity to try anything faster. I never got around to adding typical terminal features like capture or file transfers, so please don't request a copy. :)

Kermit-65 provides 80 columns and baud rates between 50 & 9600 baud and the truest vt100 emulation I have seen on the Atari. I am using it at 2400 baud right now, and have benn using for a couple of years. When using it at baud rates above 1200, you have you have to issue the command "set flow on" to prevent it from losing characters, and it works flawlessly at 2400 baud. I haven't tested any of the baud rates greater than 2400.

Kermit-65 and its source code is available at the atari archive.

To answer those questions about the Dungeon...

(major spoilers follow....)

1. You need to give the ferryman *2* coins at *midnight* to get him to take you across the river. No, it doesn't have to be *exactly* at midnight. Any time during the "hour 0" will do.

2. The amethyst rod will unlock locked doors if you (U)se it while in front of one. It also has some other magical power, but I forget just what.

3. "Wear" Morganas Tierra. It's something good, but again, I forget *exactly* what *type* of protection it offers.

3867. 80 columns and baud rate

Newsgroup: comp.sys.atari.8bit
Date: 1991-04-07 01:27:53 UTC
From: wilmott@utopia.rutgers.edu
Message-ID: <Apr.6.20.27.51.1991.770@utopia.rutgers.edu>
Source record: 114216

Okay, I ask forgiveness from all of you out there for posting this question without even bothering to seriously think about it, or trying to look up relevant information on the topic, but I just thought of something in passing a minute ago, and figured I'd put my foot in my mouth and ask...

The question concerns 80 column (via software) term programs and the (apparent) 1200 baud limit. BobTerm, I've heard, works at up to 9600 baud just fine on an unmodified 8-bit in 40 column mode (I say *heard* because I don't have a 9600 baud modem to confirm it). I have 3 different 80 column VT100 terminal emulators, and 1200 baud is as high as they go. I've heard in discussions here and elsewhere that the reason for this is that what these programs are doing is actually drawing, character by character, every byte on a graphics 8 screen, and that there's so much overhead for doing this that the little old Atari can't keep up. That's all well and good, but wouldn't it be possible to patch directly into the OS and make the machine think that it's normal mode of operation is graphics 8, not graphics 0 and give it the 80 column character set as its normal character set, thus letting the OS directly deal with drawing the screen? No, this type of approach I wouldn't expect to yield the same 9600 baud rate since a "higher res" screen is being handled, but I would think that 2400 baud should be able to be achieved. Isn't a graphics 0 screen made up of 8x8 bit characters, 40 column across and 20 columns down? And a graphics 8 screen 320x192 pixels? (this is from memory so...)
If so, thats 51,200 pixels versus 61,440 pixels. So why can one only go 1200 baud while the other can go 9600 baud? Seems to me its only because one *directly* uses the OS to draw the screen in a native manner, while the other fights against the OS to forcibly draw a slightly higher res screen.

And so...wouldn't it be possible to patch into and rewrite part of the OS to make *it* naturally handle a graphics 8 screen of text? On the old 800 and 400 this would be a trick since the OS is in ROM, but on the XL/XE class machines, you could copy the OS to the RAM underneath and then just patch whatever you want in there.

Again, this is just a brief idea, without much thought into the matter - I eagerly await someone to tell me where my reasoning is fouled up (or to prove me right and make a 2400 baud 80 col term). Thanks.

-Ray

You can, but you would gain nothing. In fact, most (many) 80-column
emulators use a custom device handler to hook into the Operating System,
which "lets the OS directly deal with" the screen handling; it's not the
OS link that's the problem. See below...

>Isn't a graphics 0 screen made up
>of 8x8 bit characters, 40 column across and 20 columns down? And a
>graphics 8 screen 320x192 pixels? (this is from memory so...)

>because one *directly* uses the OS to draw the screen in a native
>manner, while the other fights against the OS to forcibly draw
>a slightly higher res screen.

The difference lies in the way that screen data is interpreted in each mode.
In graphics mode 0, one single byte acts as a pointer to the ROM-based
character set at $E000. Thus, the value of 1 stored into screen memory
in graphics mode 0 causes a '!' to appear on the screen (note that these
"internal" character numbers are not ATASCII). One single byte causes 8
predefined bytes of data, with 8 bits per byte, to appear on the screen in
the form of a character. So with one byte, you're getting 64 bits, but you
don't have the same kind of control you do in bitmap modes (see below).
Graphics mode 0 takes up 40 x 24 = 960 bytes.

Graphics mode 8, on the other hand, is a bitmap mode. One single byte causes
1 byte of data to appear on the screen, in the form of 8 bits horizontally.
A '1' stored to screen memory in graphics 8 would appear as

X

Where X is the bit you turned on. A '255' stored to screen memory in graphics
8 would cause the following to appear:

XXXXXXXX

See? The binary representation of '255' is '11111111', and this is mapped
directly to the screen. A graphics mode 8 (or, to be technically precise,
mode 8+16 -- mode 8 with no text window) screen takes 40 x 192 = 7680
bytes. Why 40 x 192? 320 pixels horizontally / 8 pixels per byte = 40

bytes horizontally, and vertically there are 192 individually addressable lines in the display list, so that's 40 x 192.

>And so...wouldn't it be possible to patch into and rewrite part of
>the OS to make *it* naturally handle a graphics 8 screen of text?
>On the old 800 and 400 this would be a trick since the OS is in ROM,
>but on the XL/XE class machines, you could copy the OS to the RAM
>underneath and then just patch whatever you want in there.

The problem is not the Operating System. Actually the Atari is amazingly flexible in that it allows you to create your own device handlers, which is what most 80 column programs do. These device handlers interface to the O.S. just as the built-in device handlers do, with no inherent loss of efficiency; all you do is modify a few pointer tables. It's the programmer's responsibility to write efficeient real-time device handlers. For instance, a typical 80-column emulator will replace the E: handler, which is the screen editor.

You could, for instance, write an E: handler to emulate a graphics mode 0 screen in graphics 8, but it would run SLOWER even though it would appear to be the SAME. Why? You'd have to write the 8 times as much data to the screen. You'd need to, yourself, use the character number as a pointer, fetch the 8 bytes of character set data from the character set map, then write those EIGHT bytes to the screen. In graphics mode 0, the hardware (presumably ANTIC) does this by itself (incidentally it 'steals' cycles from the CPU to do this, which is why things run thirty-some percent faster when you turn off the screen).

Things slow down even more when you try to go to 80 columns. An 80 column character is 4 bits wide, while screen data in graphics 8 is 8 bits wide. This means you have to do bit shifting or, at the very least, bit masking, which adds a bit of overhead to every single character you write to the screen. And when updating a whole screen, that adds up quickly.

>Again, this is just a brief idea, without much thought into the
>matter - I eagerly await someone to tell me where my reasoning is
>fouled up (or to prove me right and make a 2400 baud 80 col term).

Hex numbers do not exist in standard Atari BASIC.
To do bit manipulations you'll need to either do them in machine language,
or split each byte into its bits in Basic.

Ray asked about 80 columns (software) and baud rate.

Ok Ray, here's the scoop -
graphics 0 uses about 2k of memory - 1k for the character set, 1k for the actual screen, and about 50 bytes for the display list.
graphics 8 text uses about 9k of memory - 1k for the character set, 8k for the actual screen, and another 250 bytes or so for the display list.

Antic is what generates the screen displays. To do this it interrupts the 6502, reads memory, and then returns control to the 6502. It performs this interrupt once per screen line. In a gr. 0 screen there are only 24 lines. In a gr. 8 screen there are 192. As you can see, this means that a gr.8 screen takes about 8 times more interrupts. That isn't all of it... When a gr.0 screen is scrolled, only 1k has to be moved. When a gr.8 screen is scrolled, 8k has to be moved. This movement is the real killer.

Ok, continuing along...most programs just use the standard handlers for the screen and the modem. The screen handler is slow, and the modem handlers usually aren't super fast either. Bobterm will work at 2400 (and probably higher) using an XEP80. Express 3.0 tends to fail at 2400 using the XEP80. The difference (so I've been told) is in the screen handlers - Bobterm uses a custom one which is faster.
The only adequate reason for 1200 only term programs is because the authors just couldn't figure out how to get 2400 to work. It's possible, but not worth the effort (to the authors in any case).

As for rewriting the OS to use the 80 column screen normally - this can be done, but isn't worth it unless the screen memory (8k) is taken from extended memory and only the 130xe has that feature.

3871. 1090xl expansion module

Newsgroup: comp.sys.atari.8bit
Date: 1991-04-07 04:56:43 UTC
From: wilmott@utopia.rutgers.edu
Message-ID: <Apr.6.23.56.26.1991.858@utopia.rutgers.edu>
Source record: 114219

Just thought I'd pass along some old Atari vaporware tech notes
I happened to come across recently...

HARDWARE DESCRIPTION OF THE EXPANSION BOX

The box consists of two main elements, the Buffer Box and the
Expansion Box Chassis. This document will concern itself with the
hardware inside the Expansion Box Chassis as the Buffer Box is a simple
signal buffer unit. The Expansion Chassis contains a backplane, for
option connection, a power supply and I/O channels.

The I/O channels consist of two serial RS232C channels and one
Centronics type parallel output port. These functions are created by
two 68B50 ACIAs, one 68B21 PIA, and a BR1943 baud rate generator.
Figure 1 shows the locations of the devices in the memory map. All the
devices respond to Parallel Bus Device #6.

Location	Device
D100H	68B50 Channel A
D104H	68B50 Channel B
D108H	68B21
D110H	1943

Figure 1

Parallel Channel Description

The Parallel channel uses a 68B21 PIA. There are 11 signals
implemented in the Centronics Interface. These signals are D0-D7, Data
Strobe, Busy, and Fault. The data lines use port A in the PIA and are
output only. Data Strobe is an output line from port B bit 4 which is
used to strobe data to the printer. This signal should be active after
data is stable and the printer is not busy. Busy is an input line of
port B bit 5. This input controls the flow of data to the printer; it
should be checked before next data transmission. Fault is an input of
port B bit 6. This input indicates if the printer had a fault (ie.
paper out) and should always be checked. Figure 2 shows the port
assignments for the PIA. The register types and control bits are the
same as the standard Atari PIA used in current computers.

Port	Direction	Description

A0	Output	Data Bit 0
A1	Output	Data Bit 1
A2	Output	Data Bit 2
A3	Output	Data Bit 3
A4	Output	Data Bit 4
A5	Output	Data Bit 5
A6	Output	Data Bit 6
A7	Output	Data Bit 7
B0	Input	DSR' Channel A
B1	Output	DTR' Channel A
B2	Output	DTR' Channel B
B3	Input	DSR' Channel B
B4	Output	Data Strobe'
B5	Input	Busy'
B6	Input	Fault'
B7	Not Used	Not Used

Figure 2

Baud Rate Selection

The baud rate for the two serial channels is created by a BR1943 baud rate generator. This device creates two different baud rates using one write only register. The upper four bits of this register controls the baud rate for Channel B, the lower four bits control Channel A. Figure 3 shows the four bit combinations for the 16 different baud rates.

Sel Value	Baud Rate
0000	50
0001	75
0010	110
0011	134.5
0100	150
0101	200
0110	300
0111	600
1000	1200
1001	1800
1010	2400
1011	3600
1100	4800
1101	7200
1110	9600
1111	19200

Figure 3

Serial Channels

The two serial channels are a full RS-232C type. These channels use the baud rates from above, handshake internal to the ACIA as well as extra handshake lines from the PIA. The ACIA operation is described below as well as register locations. The software should provide correct operation of the extra handshake lines for full modem control.

ACIA REGISTERS DESCRIPTION

The ACIA has internal registers on the chip that are used for the status, control, receiving, and transmitting of data. The content of each of the registers is summarized in Table 1.

Data Bus #	Transmit Data Register	Receive Data Register	Control Register	Status Register
0	Data 0	Data 0	C D Sel 1 CRO	RDRF
1	Data 1	Data 1	C D Sel 2 CR1	TDRE
2	Data 2	Data 2	Word Sel 1 CR2	DCD'
3	Data 3	Data 3	Word Sel 2 CR3	CTS'
4	Data 4	Data 4	Word Sel 3 CR4	Frame Error
5	Data 5	Data 5	Transmit Con 1 CR5	Receiver Overrun
6	Data 6	Data 6	Transmit Con 2 CR6	Parity Error
7	Data 7	Data 7	Rec Int En CR7	Interrupt Request

Table 1
Definition of ACIA Register Contents

TRANSMIT DATA REGISTER (TDR)

Data is written in the Transmit Data Register during the negative transition of the enable (E) when the ACIA has been addressed and RS . R/W is selected. Writing data into the register causes the Transmit Data Register Empty bit in the Status Register to go low. Data can then be transmitted. If the transmitter is idling and no character is being transmitted, then the transfer will take place within one bit time of the trailing edge of the Write command. If a character is being transmitted, the new data character will commence as soon as the previous character is complete. The transfer of data causes the Transmit Data Register Empty (TDRE) bit to indicate empty.

RECEIVE DATA REGISTER (RDR)

Data is automatically transferred to the empty Receive Data Register (RDR) from the receiver deserializer (a shift register) upon receiving a complete character. This event causes the Receive Data Register Full bit (RDRF) in the status buffer to go high (full). Data may then be read through the bus by addressing the ACIA and selecting the Receive Data Register with RS and R/W high when the ACIA is enabled. The non-destructive read cycle causes the RDRF bit to be cleared to empty although the data is retained in the RDR. The status is maintained by RDRF as to whether or not the data is current. When the Receive Data

Register is full, the automatic transfer of data from the Receiver Shift Register to the Data Register is inhibited and the RDR contents remain valid with its current status stored in the Status register.

CONTROL REGISTER

The ACIA Control Register consists of eight bits of write-only buffer that are selected when RS and R/W are low. This register controls the function of the receiver, transmitter, interrupt enables, and the Request-to-Send peripheral/modem control output.

Counter Divide Select Bits (CR0 and CR1) - The counter Divide Select Bits (CR0 and CR1) determine the divide ratios utilized in both the transmitter and receiver sections of the ACIA. Additionally, these bits are used to provide a master reset for the ACIA which clears the Status Register (except for external conditions on CTS and DCD) and initializes both the receiver and transmitter. Master reset does not affect other Control Register bits. Note that after power-on or a power fail/restart, these bits must be set high to reset the ACIA. After resetting, the clock divide ratio may be selected. These counter select bits provide for the following clock divide ratios:

CR1	CR0	Function
0	0	Divide by 1
0	1	Divide by 16
1	0	Divide by 64
1	1	Master Reset

Word Select Bits (CR2, CR3, and CR4) - The Word Select bits are used to select word length, parity, and the number of stop bits. The encoding format is as follows:

CR4	CR3	CR2	Function
0	0	0	7 Bits Even Parity 2 Stop Bits
0	0	1	7 Bits Odd Parity 2 Stop Bits
0	1	0	7 Bits Even Parity 1 Stop Bit
0	1	1	7 Bits Odd Parity 1 Stop Bit
1	0	0	8 Bits 2 Stop Bits
1	0	1	8 Bits 1 Stop Bit
1	1	0	8 Bits Even Parity 1 Stop Bit
1	1	1	8 Bits Odd Parity 1 Stop Bit

Word length, Parity Select, and Stop Bit changes are not buffered and therefore become effective immediately.

Transmitter Control Bits (CR5 and CR6) - Two Transmitter Control bits provide for the control of the interrupt from the Transmit data

Register Empty condition, the Request-to-Send (RTS) output, and the transmission of a Break level (space). The following encoding format is used:

CR6	CR5	Function
0	0	RTS'=LOW Trans INT Disabled
0	1	RTS'=LOW Trans INT Enabled
1	0	RTS'=HIGH Trans INT Disabled
1	1	RTS'=LOW Trans a BREAK CHAR

Receive Interrupt Enable Bit (CR7) - The following interrupts will be enabled by a high level in bit position 7 of the Control Register (CR7): Receive Data Register Full, Overrun, or a low to high transition on the Data Carrier Detect (DCD) signal line.

STATUS REGISTER

Information on the status of the ACIA is available to the MPU by reading the ACIA Status Register. This read-only register is selected when RS is low and R/W is high. Information stored in this register indicates the status of the Transmit Data Register, the Receive Data Register and error logic, and the peripheral/modem status inputs of the ACIA.

Receive Data Register Full (RDRF), Bit 0 - Receive Data Register Full indicates that received data has been transferred to the Receive Data Register. RDRF is cleared after an MPU read of the Receive Data Register or by a master reset. The cleared or empty state indicates that the contents of the Receive Data Register are not current. Data Carrier Detect being high also causes RDRF to indicate empty.

Transmit Data Register Empty (TDRE), Bit 1 - The Transmit Data Register Empty bit being set high indicates that the Transmit Data Register contents have been transferred and that new data may be entered. The low state indicates that the register is full and that transmission of a new character has not begun since the last write data command.

Data Carrier Detect (DCD), Bit 2 - The Data Carrier Detect bit will be high when the DCD input from a modem has gone high to indicate that a carrier is not present. This bit going high causes an Interrupt Request to be generated when the Receive Interrupt Enable is set. It remains high after the DCD input is returned low until cleared by first reading the Status Register and then the Data Register or until a master reset occurs. If the DCD input remains high after read status and read data or master reset has occured, the interrupt is cleared, the DCD status bit remains high and will follow the DCD input.

Clear-to-Send (CTS), Bit 3 - The Clear-to-Send bit indicates the state of the Clear-to-Send input from a modem. A low CTS indicates

that there is a Clear-to-Send from the modem. In the high state, the Transmit Data Register Empty bit is inhibited and the Clear-to-Send status bit will be high. Master reset does not affect the Clear-to-Send Status bit.

Framing Error (FE), Bit 4 - Framing error indicates that the received character is improperly framed by a start and a stop bit and is detected by the absence of the 1st stop bit. This error indicates a synchronization error, faulty transmission, or a break condition. The framing error flag is set or reset during the receive data transfer time. Therefore, this error indicator is present throughout the time that the associated character is available.

Receiver Overrun (OVRN), Bit 5 - Overrun is an error flag that indicates that one or more characters in the data stream were lost. That is, a character or a number of characters were received but not read from the Receive Data Register (RDR) prior to subsequent characters being received. The overrun condition begins at the midpoint of the last bit of the second character received in succession without a read of the RDR having occurred. The Overrun does not occur in the Status Register until the valid character prior to Overrun has been read. The RDRF bit remains set until the Overrun is reset. Character synchronization is maintained during the Overrun condition. The Overrun indication is reset after the reading of data from the Receive Data Register or by a Master Reset.

Parity Error (PE), Bit 6 - The parity error flag indicates that the number of highs (ones) in the character does not agree with the preselected odd or even parity. Odd parity is defined to be when the total number of ones is odd. The parity error indication will be present as long as the data character is in the RDR. If no parity is selected, then both the transmitter parity generator output and the receiver parity check results are inhibited.

Interrupt Request (IRQ), Bit 7 - The IRQ bit indicates the state of the IRQ output. Any interrupt condition with its applicable enable will be indicated in this status bit. Anytime the IRQ output is low the IRQ bit will be high to indicate the interrupt or service request status. IRQ is cleared by a read operation to the Receive Data Register or a write operation to the Transmit Data Register.

Expansion Box Specifications

7/27/83

1.0 Introduction

The Expansion Box will be a buffered extension of the Parallel Bus Interface (P.B.I.) allowing system expansion and enhancement. The bus will enable the consumer to connect a variety of different devices to the Parallel Bus Interface. Some future devices are listed below.

1) Disk Drive Controller-*
2) Votrax-
3) Modem (300 and/or 1200)-*
4) Touch Tone Decoder-
5) EPROM Programmer-
6) B.S.R. Controller Interface-
7) Relay Switch Card-
8) IEEE 488 Control Card-*
9) Real Time Clock-
10) 80 Column Display-*
11) Printer Spooler/Buffer-
12) APPLE Card-*
13) VCS Adapter Card-*
14) A/D Converter Card-*
15) Infra Red Interface-*
16) Hard Disk Interface-*
17) Music Card-
18) Speech Recognition-*
19) Ram Disk-*
20) Battery Back-up CMOS RAM-
21) Corvus Interface-*
22) Ethernet Interface-*

* indicates a smart device.

1.1 Product Objectives

A. To provide future system expansion.
B. To provide multiple device access to the P.B.I.
C. To provide an interface standard to envoke interest from
peripheral manufacturers in developing P.B.I. Devices.

1.2 References

Sweet 16 Expansion Box Specification, A. Chopra
P.B.I. Specification, S. Miller
SURELY O.S. Rom Specification, S. Scheiman R. Nordin
Software Implementation of Parallel Devices, R. Nordin

2.0 Product Description

The Expansion Box will provide two RS-232C Serial Channels and one
Centronics type Parallel Output Port in addition to eight (8) expansion
slots. The connection to the XL-Series computer is made through the
Parallel Bus Interface. Devices that plug into the P.B.I. are called
Parallel Bus Devices (P.B.D.). The Expansion Box is a P.B.D.. The
Interface in the Expansion Box to the expansion devices is called the
Expansion Box Interface (E.B.I.). Modules that plug into the expansion
slots will be called Expansion Box Devices (E.B.D.).

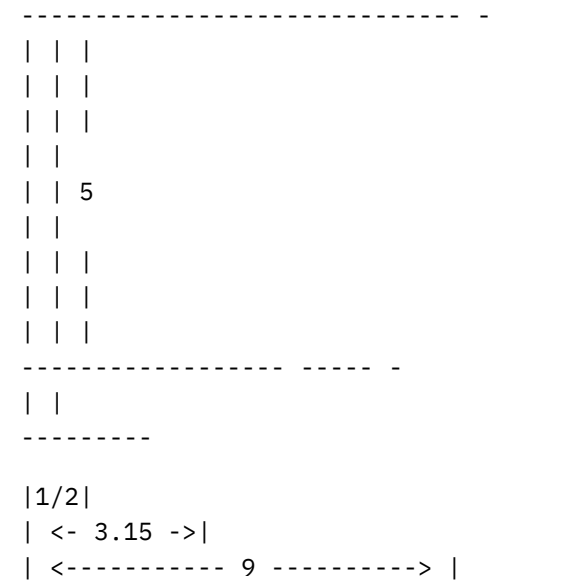
2.1 Mechanical

2.1.1 Appearance

The Expansion Box should match the styling of the current XL product line. The Box should have all connections from devices, power, and bus signals in the rear of the box. The power switch and power indicator light should be placed on the front panel.

2.2.2 Design Concepts

The Expansion Box should not require more than one square foot of table space. It should also be able to support a 13 inch color television. The top must be easily removable so the user can access the option cards, but not be able to access the power supply or come in contact with the Line Voltage. The Box will support eight 9 by 5 inch option cards (see figure 1).



(all measurements are in inches)

Figure 1 P.B.D. Card Size

2.2 Electrical

2.2.1 Expansion Box Interface

The E.B.I. contains all the signals in the P.B.I. plus power for the E.B.D.. The description of the E.B.I. in this document is similar to that of the P.B.I. but note the differences in timing and loading.

2.2.1.1 Connector

The Expansion Box Interface signals will be accessible through a 50-pin connector. This connector is an AMP type 67987-4. It will mate to a standard card edge with gold plated fingers at .100 inch centers.

2.2.1.2 Signals

Shown in Figure 2 is the pin-out of the connector looking into the expansion box. The signal pin numbers and signal names are described below.

Pin 2 EXTSEL' External Select (Input) ==> This open collector line is generated internally by the Expansion Box Device (E.B.D.). This signal should be active low whenever EXTENB is active and the E.B.D. is selected and there is a valid E.B.D. address on the bus. EXTSEL' causes a CAS' inhibit on the main board allowing a remapping process. Although an E.B.D. can be mapped in any VALID RAM location, these devices should follow the ATARI guidelines for E.B.D. locations so future ATARI devices can be used. The drive device should be capable of sinking 10mA.

Pin 3 A0 Address Line 0 (Output) ==> Address line 0 is a buffered output from the microprocessor.

Pin 4 A1 Address Line 1. Same as above.

Pin 5 A2 Address Line 2. Same as above.

Pin 6 A3 Address Line 3. Same as above.

Pin 7 A4 Address Line 4. Same as above.

Pin 8 A5 Address Line 5. Same as above.

Pin 9 A6 Address Line 6. Same as above.

Pin 11 A7 Address Line 7. Same as above.

Pin 12 A8 Address Line 8. Same as above.

Pin 13 A9 Address Line 9. Same as above.

Pin 14 A10 Address Line 10. Same as above.

Pin 15 A11 Address Line 11. Same as above.

Pin 16 A12 Address Line 12. Same as above.

Pin 17 A13 Address Line 13. Same as above.

Pin 18 A14 Address Line 14. Same as above.

Pin 20 A15 Address Line 15. Same as above.

Pin 21 D0 Data Line 0 (Bi-directional) ==> Data line 0 is a buffered bi-directional data line.

Pin 22 D1 Data Line 1. Same as above.

Pin 23 D2 Data Line 2. Same as above.

Pin 24 D3 Data Line 3. Same as above.

Pin 25 D4 Data Line 4. Same as above.

Pin 26 D5 Data Line 5. Same as above.

Pin 27 D6 Data Line 6. same as above.

Pin 28 D7 Data Line 7. Same as above.

Pin 31 B02 Buffered Phase 2 Clock (Output) ==> This clock output line is a buffered phase 2 clock from the processor.

Pin 34 RST' Reset (Output) ==> Reset is an active low signal which occurs either on power-up or by depressing the reset key on the computer.

Pin 35 IRQ' Interrupt Request (Input) ==> This open collector line creates an interrupt on the microprocessor. The interrupt can then invoke the handler ROM or other service routines for the E.B.D.. The driving device should be capable of sinking 10mA.

Pin 36 RDY Ready (Input) ==> This open collector input signal allows the E.B.D. to halt the microprocessor ONLY during read cycles. This will extend the read cycle for slow peripherals. The driving device should be capable of sinking 10mA.

Pin 38 EXTENB External Decoder Enable (Output) ==> This output goes high when there is a valid ram access. Any E.B.D. can map during a valid EXTENB but the E.B.D. should only map in according to ATARI specified address locations.

Pin 40 REF' Refresh (Output) ==> This output can be for refresh timing on volatile memories connected to the E.B.I..

Pin 41 CAS' Column Address Strobe (Output) ==> This output can be used for access of DRAM external to the computer. Due to timing restrictions caution should be taken when using this signal in the expansion box.

Pin 43 MPD' Math Pack Disable (Input) ==> This open collector input is used to disable the math pack section of the OS ROM (D800H-DFFFH). This should be done when the E.B.D. is selected and has a handler resident. The driving device should be capable of sinking 10mA.

Pin 44 RAS' Row Address Strobe (Output) ==> This output can be used for access of DRAM external to the computer. Due to timing restrictions caution should be taken when using this signal in the expansion box.

Pin 46 LR/W' Latched Read Write (Output) ==> This output is active high for a read cycle and active low for a write cycle.

Pin 49 AUDIO Audio In (Input) ==> This line is tied directly to the audio summation network of the computer. The audio signal input is 100 mV peak to peak with 4.7K ohm source impedance.

Pins 1,10,19,29,30,32,42,45,50 are Ground (GND).

Pins 33,47,48 are +5 Volts.

Pin 37 is -12 Volts.

Pin 39 is +12 Volts.

2.2.1.3 Interface Requirements

For peripherals to interface through the E.B.I. to the computer the following requirements must be followed.

2.2.1.3.1 D.C. Characteristics

All E.B.I. outputs from the Buffer Box have the capability of driving TTL load.

All E.B.I. open collector input lines must be able to sink 10mA (min) at .4V (max).

All E.B.I. non-open collector input lines except AUDIO must have the drive capability of 48mA at logic 0 (Iol) and -15mA at logic 1 (Ioh).

All E.B.I. signals except AUDIO will be at standard TTL logic levels.

The AUDIO input line must drive a 4.7K Ohm source impedance with a 100mV peak to peak signal.

2.2.1.4 Hardware Device Protocol

The E.B.I. is designed to support two types of devices. The first is an Expansion Box Peripheral (E.B.P.) and the second is an External Application Cartridge (E.A.C.).

2.2.1.4.1 Expansion Bus Peripherals (E.B.P.)

The E.B.P.s have the following characteristics:

1. The interface between the E.B.P. and the CPU is defined through the handler/OS resident in the OS ROM. The OS can support 8 devices at one time with only one enabled during any given interval.

2. Every E.B.P. has a unique handler that resides in the CPU memory from D800H-DFFFH. The ROMS containing the code for these handlers are physically resident on the respective E.B.P.s. To access this handler, the math pack must be disabled with MPD'. When the math pack is disabled (this should happen whenever the E.B.P. is selected and has an external handler) the computer will generate EXTENB for the math pack area. The E.B.P. must generate the correct EXTENB/EXTSEL' protocol. If the device does not generate EXTSEL' the CPU will access (in the 64K computers) an unused area of ram. This area should not be used since all computers of this series do not have that area of ram.

3. The location D1FFH in the CPU memory map is reserved for passing control information between the CPU and the E.B.P.s. The CPU selects one of the E.B.P. devices by writing a "1" into the desired bit in location D1FFH. The device can be deselected by writing a "0" into the desired bit.

```
7 6 5 4 3 2 1 0
----------------------------------------
| D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 |
----------------------------------------
```

Therefore the CPU can then access 8 devices, one at a time. If the IRQ' line is pulled "low" the CPU can read the status for location D1FFH and locate the requesting E.B.P.. A "1" in a bit Ix (where x=0 to 7) corresponds to an interrupt in E.B.P. x. If the bit is a "0" then the device has not caused the interrupt. The E.B.P. must clear the interrupt flag when the interrupt is being serviced.

```
7 6 5 4 3 2 1 0
----------------------------------------
| I7 | I6 | I5 | I4 | I3 | I2 | I1 | I0 |
----------------------------------------
```

4. An E.B.P. should assert MPD' only when it is selected. An E.B.P. should assert EXTSEL' only when it is selected and if EXTENB' is asserted.

5. An E.B.P. may respond to any selects D0 through D7. It is recommended that the E.B.P.s have configuration switches to allow them to respond to any one of the selects. Some of the computer systems use the E.B.I. to support internal devices therefore the user should check

each manual for device locations. If the system has devices in specific locations, those are reserved in that computer.

6. An E.B.P. handler may respond to addresses in the region D800H-DFFFH only when it is selected.

7. A peripheral may respond to addresses in the region D100H to D1FEH only when selected.

8. The E.B.P.s will have software priority over the SIO peripheral when they are addressed generically.

9. Data transfer between the CPU and the E.B.P. is under the control of the peripheral handler for the E.B.P.s. The peripheral handler may or may not be in the E.B.P. Data transfer is handled by a combination of code in the O.S. and the E.B.P.

10. The E.B.P.s shall work if a cartridge is present in the cartridge slot.

11. The CPU address space from D600H to D7FFH is reserved for E.B.I. devices as follows:

Device	Range	Size
D0	D600H-D61FH	32 Bytes
D1	D620H-D63FH	32 Bytes
D2	D640H-D65FH	32 Bytes
D3	D660H-D67FH	32 Bytes
D4	D680H-D69FH	32 Bytes
D5	D6A0H-D6BFH	32 Bytes
D6	D6C0H-D6DFH	32 Bytes
D7	D6E0H-D6FFH	32 Bytes

The region from D700H to D7FFH is reserved for use by ATARI. The CPU address space from D600H to D7FFH is always mapped to the E.B.I. and does not require the EXTENB/EXTSEL' protocol. Some units may have devices mapped on the E.B.I.; these devices are only active when selected but care must be taken when using a unit with onboard devices.

2.2.1.4.2 External Application Cartridges

The "External Application Cartridge" (EAC) is a generalization of the E.B.P.. They have the following characteristics:

1. An EAC can reside at any or all of the locations in the region 0000H to BFFFH for which the EXTENB is generated. They may respond to these addresses only when "opened".

2. The EACs must be opened by the protocol given for the E.B.P.s.

3. The EACs must conform to the EXTENB/EXTSEL' protocol.

4. The EACs must have a handler (resident at location D800H-DFFFH) that controls their operation. The EACs must conform to conditions (4)

through (11) of section III. B. above.

5. The EACs will work if a cartridge is present in the internal cartridge slot.

2.2.2 I/O Channels

The expansion box contains two RS-232C serial channels and one Centronics type parallel printer channel. Both the serial and parallel channels are preset to device #6. This device cannot be used in the Expansion Box.

2.2.2.1 Serial Channel Description

The Expansion Box will have two RS-232C Asynchronous serial channels capable of simultaneous two way communication. Both channels should be addressable through software via CIO using the same format as the serial channels in the ATARI 850. The baud rate will be software selectable from 16 baud rates (see Table 1). The baud rates of the two channels are to be independent of each other.

Sel Value	Baud Rate
0000	50
0001	75
0010	110

Table 1 Baud Rate Selection Chart

2.2.2.2 Parallel Channel Description

The basic Parallel Channel is to support a Centronics type parallel printer. To do this the following signals are supported.

D0-D7 Data Lines
DS' Data Strobe
BUSY Busy Input
FA' Fault Input

2.2.3 Buffer Box

To allow connection to the XL-series computer, the Expansion Box will use a buffer box connected to the back of the computer. This Buffer Box will be able to drive a 3 foot long cable and the Expansion Box. The power used by the Buffer Box will be supplied by the Expansion Box on the Reserved Pins of the cable. The connectors used will be the standard 50 pin P.B.I. connectors.

2.2.4 Power Supply

The Expansion Box power supply will have sufficient output to drive each slot with .75 Amps at +5 VDC, .1 Amps at +12 VDC, and .1 Amps at -12 VDC. Table 2 shows max operating current limits of the supply. A fan might be necessary to provide cooling in the Expansion Box.

+5 VDC 6.75 Amps
+12 VDC 1.0 Amps
-12 VDC 1.0 Amps

Table 2

2.3 Software

2.3.1 Expansion Bus Protocol

The Software handlers and application programs written for use with/in the Expansion Box must follow standard Protocol defined by "The Software Implementation of Parallel Device Handlers and Drivers" by Rick Nordin. A Designers guide to interfacing devices to the PBI and Expansion Box will also contain the required documentation concerning the protocol.

2.3.2 I/O Channel Handlers

The handler used in the Expansion Box I/O channel will conform to the above specifications as well as providing support for the printer as a standard CIO device call.

2.4 Product Performance

This section will specify the projected performance of the Expansion Box. The environmental and reliability information that is included is targeted from the Sweet 16 specification.

2.4.1 Environmental

Operating Environment

Temperature =
Maximum: 45 degrees C
Minimum: 10 degrees C

Humidity =
Maximum: 90% R.H. (Non Condensing)
Minimum: 15% R.H.

Altitude =
Maximum: 3000 Meters (9840 feet) (720 millibars)
Minimum: -60 Meters (-197 feet) below sea level

Non-Operating Environment

Temperature =
Maximum: 60 degrees C
Minimum: -30 degrees C

Humidity =
Maximum: 90% R.H.
Minimum: 0% R.H.

Should condensing occur, unit must be dried off before operation.

Altitude = Same as operating

2.4.2 Endurance Levels

ESD Susceptibility

No product damage or data loss with 10 KV to 20 KV discharge at any point accessible to the user except the connectors.

Vibration

Operation: .1g +- 10% 5 to 500Hz
Resonance Search: Sine scan 5-100 Hz dwell on resonances
1.0g for 10 minutes.

Transportation: 100 to 300 cycles per minute 2 directions 90 degrees apart, 30 minutes; each frequency to be such as to raise package from the table 0.06 in., acceleration to be 1.0g (min) No Damage should result.

Impact Test: Free fall distance of 24 in. on corner, edge, and all 6 faces. No damage should occur to a packed unit.

Random Vibration: 0.04g 2Hz 15 minutes; 10 to 1000Hz 6.3g RMS

Thermal Shock: 10 degrees C for 3 hours power on raise temperature, 5 degrees per minute to 45 degrees C for 5 hours power off drop temperature 5 degrees C per minute to 10 degrees C. Repeat cycle 5 times no damage

2.4.3 MTBF & MTTR

The targeted MTBF for the Expansion Box is 8000 hours continuous power-on at 25 degrees C.

The targeted MTTR for the unit is 5 minutes.

2.4.4 Compliances

UL 114 & UL 94HB
CSA C22.2 No. 154

FCC Docket 20780, Part 15, Subpart J, Class B

Expansion Box Specifications

10/14/83

Below are the changes to the document of the same name dated 7/27/83.

1.2 Assumptions

1.2.1 Product Reasoning

This product is intended to add a strategic marketing dimension to the Atari home computer line by providing expansion capability.

1.2.2 Manufacturing

It is assumed that the Expansion Box will be manufactured by some, as yet unspecified, overseas vendor.

1.2.3 Strategic Fit

This product is intended to broaden Atari's image as a complete computer supplier. This is done by offering an expansion path for computer users to grow with their systems. A line of option cards will allow even the most sophisticated users to advance to an advanced system.

1.2.4 Product History

As of the date of this document the expansion box has been redefined as a smart device rather than an extension of the Parallel Interface Bus. This was done to facilitate third party vendors in the implementation of option cards. This will also allow for easy interfacing of the Expansion Box to the current 400/800 installed base. This choice should create added sales of this device as well as showing the public Atari will not leave current users unsupported! In addition to the above features, a RFI problem is also reduced creating a faster path to bring the product to market.

1.3 References

2.2.2.4 Hardware Device Protocol

The hardware protocol for the Expansion Box is similar to the Expansion Bus Interface on the computer in that each card is selected through a common register. There will also be device handlers on each card in a fixed location of memory. The bus timing is configured so

any type of device can be easily interfaced to the Expansion Box. For complete interfacing requirements a third party vendor document will be created with examples of interfacing methods.

2.2.3 Processor Card

2.2.3.1 CPU

The CPU for the Expansion Box will use a 6502 operating at 1 MHz. This is done for software compatibility with current developmental tools. The placement of the CPU on a card allows the user to swap other CPU cards for the 6502 card.

2.2.3.2 ROM

There is provision for 8 K Bytes of monitor Rom on the processor card. This ROM can also be disabled by asserting ROMDIS' line on the bus. The ROM will be located at E000H-FFFFH.

2.2.3.3 RAM

There is provision for 2 K Bytes of general purpose RAM on the processor card. The RAM can be disabled by asserting RAMDIS' line. This will allow for remapping of page 0 and 1 to swap tasks in and out without moving large areas of memory. The RAM will be located at the bottom of the memory space.

2.2.3.4 Serial Channel Description

The processor card will have two RS-232C asynchronous serial channels, capable of simultaneous two way communication. Both channels are addressable through the CIO in the operating system of the Atari computer. The baud rates for the channels are found in table 1. Both channels have independent transmit and receive baud rates. One of the two serial ports will be jumperable to allow operation as a SIO port for operation with current Atari 400/800 units.

2.2.3.6 Bus Interface

The Bus Interface for the processor card will support the load requirements of the Expansion Bus and follow the protocol of the Bus timing.

2.2.4 Computer Interface

The Expansion Box will interface with the Atari XL product line through an interface unit connected to the Parallel Expansion Bus. The interface unit will contain a JULIE FIFO interface chip designed to allow communications between the XL computers and the Expansion Box. In addition the interface unit will have a 2K handler rom for the P.B.I. and one LS-TTL decoder chip. Power for the interface unit will be provided by the expansion box. The Interface will be connected to the Expansion Box via a 26 conductor double shielded cable. The cable is to be 3 feet in total length.

2.2.5 Power Supply

Shown below are the total power requirements.

+5 VDC 4.5 Amps
+12 VDC 0.5 Amps
-12 VDC 0.5 Amps
+9 VDC 0.2 Amps unregulated

3.0 Future Enhancements

The future enhancements include a SIO card to allow operation with the current Atari 400/800 line as well as the option cards stated in the introduction. As of this document no option cards are defined.

4.0 Cost Targets

The targeted standard cost for this unit is $125. This cost will include the processor card with 2 serial channels and the interface to the current XL product line.

5.0 Packaging

5.1 Inner Packing

The inner packing must protect the Expansion Box and accessories from 10 drops from 24 inches on any of six surfaces, three edges radiating from one corner without any internal damage. The inner packing must also protect the Expansion Box and accessories from vibrations of 30 minutes each, 2 directions 90 degrees apart, 100-300 cycles per minute. Packing must leave the surface 0.06 inches at some time, again leaving no damage.

5.2 Display Carton

The display carton should be a six sided 24 pt. SBS (white chipboard) folding carton, printed in 4 colors plus PMS877 silver, with UV or other abrasion resistance coating. All graphics will be specified by Atari.

5.3 Shrink Wrap

The fully packaged product will be shrink wrapped to prevent damage and pilferage.

5.4 Shipping Carton

The weight and type of corrugate as well as the number of products per shipping carton are to be specified by Atari.

5.5 Carton Contents

* Expansion Box Unit
* Interface Unit for XL computers
* Interface Cable
* 2 RS-232C Cables
* Processor Card
* Owners Manual and Warranty card
* Atari products catalog

5.6 Product Name

The proposed official name is "Atari Expansion Box".

6.0 Manual Requirements

The unit will include an owners manual to be specified by Atari.

Expansion Box Specifications

5/11/84

Below are the changes to the documents of the same name dated 7/27/83 and 10/14/83 respectively.

1.0 Introduction

The Expansion Box is an extension device providing support of expansion cards for the Atari Computer line. This device provides Atari systems with expansion and enhancement. The bus enables the consumer to connect a variety of different devices to the Expansion Box Interface (E.B.I.). Some devices are listed below.

1) RAM EXPANSION
2) SERIAL/PARALLEL INTERFACE
3) Z-80 PROCESSOR
4) 80-COLUMN VIDEO MONITOR INTERFACE
5) HOBBYIST PROTOTYPING CARD

2.1.1 Appearance

The Expansion Box matches the styling of the current XL product line. The Box has all connections to devices and power in the rear of the box. A flat cable (connected to the front of the box) connects the Expansion Box to all PBI-equipped computers.

2.1.2 Design Concepts

The Expansion Box requires less than one square foot of table space. The top is easily removable so the user can access the option cards. The Box supports five 9 by 5 inch option cards. To remove the top of the box, the AC adaptor must be unplugged from the box.

2.2.1 Architectural Overview

The expansion box contains a triple-output power supply providing regulated +12 volts and -12 volts and +10 volts unregulated. Also provided is a half-wave rectified AC waveform (for power-line frequency reference only) and +5 volts (for reference only).

The address bus, data bus and control lines are buffered by the expansion box and bussed to the five edge connectors provided.

2.2.2.1 Connector

The Expansion Box Interface signals are accessible through a 50-pin connector. This connector is an AMP type 2-530843-9. It mates to a standard card edge with gold plated fingers at .100 inch centers.

2.2.2.3.1 D.C. Characteristics

All E.B.I. outputs have the drive capability of 24mA at logic 0 (Iol) and -6mA at logic 1 (Ioh).

All E.B.I. open collector input lines must be able to sink 10mA (min) at .4V (max).

All E.B.I. non-open collecotr input lines except AUDIO must have the drive capability of 24mA at logic 0 (Iol) and -6mA at logic 1 (Ioh).

All E.B.I. signals except AUDIO will be at standard TTL logic levels.

The AUDIO input line must drive a 4.7KOhm source impedance with a 100mV peak to peak signal.

Each expansion box card should not load any E.B.I. output line with more than three standard TTL loads.

2.2.2.3.2 A.C. Characteristics

All specifications are referenced to the standard 2 MHz 6502 specifications.

The signal PHASE2 is the 6502 clock at the processor.

2.2.2.3.3 Materials Requirements

Contact fingers shall be plated with nickel of the low-stress type, Class II per federal specification QQ-N290A. Nickel plate thickness shall be 100 +/- 25 microinches. The nickel plating shall be overplated with gold type II (23+ karat), 15 microinches minimum (130-200 knoop hardness) or 10 microinches minimum (201 or over knoop hardness). Impurities shall not exceed .1%, not including metallic hardeners. Roughness shall be less than 50 microinches.

2.2.3 Power Supply

The power supply is comprised of an external AC adaptor capable of providing 40VA at 9.5 vAC to the Expansion Box and an internal rectifier/filter/regulator system. This system provides:

+10 vDC UNREGULATED (+40% or -15%) at .5A per card slot.
+12 vDC REGULATED (+ or - 4%) at 30mA per card slot.
-12 vDC REGULATED (+ or - 4%) at 30mA per card slot.
+5 VREF REGULATED (+ or - 4%) as a reference only.
AC - a 60 Hz reference only.

Total supply current capacity is five times the per card slot amounts.

It is recommended that the Expansion Box NOT be operated with the cover removed for safety reasons and to comply with radiated emissions standards.

3.0 Notes

3.1 RAM 64KMR

The RAM 64KMR module is designed to be used in the expansion box. However, it does not completely adhere to the E.B.I. protocol since it will allow RAM to be selected in lieu of the O/S (when used in the "1064 mode".)

3.2 RESERVED MEMORY LOCATIONS

The memory space from D100H to D1AFH is available for use by most applications. This space should be used by a device with the device select bit enabling its use. If the device select bit is not used, there is potential bus conflict between E.B.D.s. The remainder of the I/O space between D1B0H and D1FFH is mapped as follows:

D1B0H - D1C7H Speech/Modem/Disk Registers
D1C8H - D1CEH Atari Reserved

D1CFH Alternate Interrupt Register (1450 only)
D1D0H - D1DFH Audio Registers
D1E0H - D1E7H Atari Reserved
D1E8H - D1EFH Parallel/Serial Registers
D1F0H - D1F7H Alternate CPU Registers
D1F8H - D1FDH 80 Column Video Registers
D1FEH RAM Bank Select Register
D1FFH E.B.D. Select/Interrupt Register

PARALLEL BUS INTERFACE SPECIFICATIONS

1.0 Introduction:

The Parallel Bus Interface (PBI) is provided on the S-16 to support high speed peripherals, communication devices and cartridges.

The objective of the PBI is two-fold:

(1) To provide for future system improvement and expansion of the S-16.

(2) To provide a simplified interface standard that will envoke interest from peripheral manufacturers in making peripherals for the S-16.

The physical connection of the peripherals to the S-16 is conceived of being through a unit called the "Expansion Box". Roughly, the "Expansion Box" provides a low cost, easy-to-use multiple access mechanism to the PBI. It consists of electronics necessary to implement the interface protocol between the CPU and the Parallel Bus peripherals. Further details of the Expansion box are TBD.

This document gives a logical definition of the pins on the PBI. It defines the characteristics of devices that can be supported on the PBI.

The electrical specifications of the PBI signals and the details of the PBI protocol are in the S-16 Product Specification.

2.0 THE PARALLEL BUS INTERFACE

The Parallel Bus Interface Connector is a 50 pin connector (See figure 5.2.9) with the following signals.

PIN 3 through PIN 18 are A0 through A15 respectively. These are the CPU address lines. The CPU addresses the Parallel Bus Interface devices using these lines.

PIN 19 through PIN 26 are D0 through D7 respectively. These are the processor data lines. The CPU transmits and receives data and control information from the Parallel Bus Interface devices on these lines.

PINS 35, 36, and 37: are COMM A, COMM B, and COMM C select lines respectively. The Parallel Bus Interface devices lie in the CPU memory map. Three 256 byte segments of the CPU memory map are reserved for

control of the parallel bus devices. COMM A selects the segment from D600 to D6FF. COMM B selects the segment from D700 to D7FF. COMM C selects the segment from D100 to D1FF. COMM A, COMM B, and COMM C are low when active.

PIN 31 is for the Buffered Phase 2 Clock (B02) Output to the Parallel Bus Interface devices.

PINS 2, 44, 45, and 46 are not connected.

PIN 29 is the IRQ (Interrupt Request) input from the Parallel Bus Interface devices. A PBI device can pull this input low to invoke the device handler that services the parallel bus device. This input is "open drain".

PIN 32 is the Read/Write (R/W) Output to the Parallel Bus Interface devices. This line is "high" for a read cycle. It is low for a write cycle.

PIN 34 is the PoWeR ON (PWRON) Input from the Parallel Bus Interface devices. This input will allow the implementation of the "auto-wakeup" feature in future enhancements of the S-16. This signal is "low" when active.

PIN 38 is reserved for future expansion.

PIN 33 is Power on Reset (POR) ouput to the Parallel Bus Interface devices. This output resets any device so designed on power up and when the RESET key on the S-16 keyboard is hit.

PIN 49 is audio in and out signal from/to the Parallel Bus devices. This line is connected directly to the audio summation network of the S-16. This audio signal is a 1 volt peak to peak.

PIN 39 is the MODSEN (Module Sense) input from the Parallel Bus Interface Modules. This input is pulled low whenever a Parallel Bus Interface module is connected to the PBI.

PINS 47 and 48 are GROUND.

PIN 28 is External Decoder Enable (EXTENB) Output. This output goes high when an address on the CPU bus is an allowed address for a PBI device. The S-16 generates the EXTENB signal for all segments of the CPU memory map except:

(a) The Active segments of the O.S. ROM. Any disabled segments of the O.S. ROM generate the EXTENB signal when addressed.

(b) The region occupied by the internal cartridge (if present).

PIN 27 is the External Select (EXTSEL) Input. This input is generated by the (external) decoder resident in the PBI device. This signal should go low whenever the EXTENB is enabled and the PBI device uses the address generated on the CPU Bus. This input is used to disable the S-16 decoder for the duration of the current bus cycle.

PIN 30 is the RDY input to the S-16. A slow PBI device can extend the CPU bus cycle by pulling this line low when it is addressed.

PIN 40 is the Refresh (REF) output. This output may be used for the refresh timing of volitile memories connected to the PBI.

PIN 1 and PIN 50 are shield grounds.

PIN 41 is Auto-run Present (ARP) pin. This pin goes high whenever an auto-run cartridge is present at the PBI. All auto-run cartridges should pull this line to the "high" state internally.

PIN 42 is Auto-run Disable (ARD) pin. This pin goes high whenever a cartridge is present in the internal cartridge slot. The Auto-run cartridge should disable their decoder whenever this line is in the "high" state.

PIN 43 is Math Pak Disable (MPD) input from the PBI devices. This input is pulled to the "low" state whenever a Parallel Bus Peripheral is selected by the CPU (the enable bit in location D1FDH is set).

FIGURE 5.2.9 PBI Connector

3.0 Parallel Bus Devices

The Parallel bus will support 3 types of devices:

3.1 Auto-Run Cartridges:

These cartridges are functionally identical to those that plug into the cartridge slot of the S-16 except that they can be up to 32K Bytes in size (in 4K Byte increments). The top address for these cartridges must be BFFFH and they must assert the "AUTO-RUN PRESENT" line when inserted into the expansion box. The auto-run cartridges work under the following constraints:

(a) Only one such cartridge will work at a time.

(b) If a cartridge is present in the internal cartridge slot, the auto-run cartridge is ignored by the S-16.

(c) If no cartridge is present in the internal cartridge slot the auto-run cartridges operate in a manner identical to the cartridge slot cartridges. No additional handlers or O.S. changes are needed.

(d) If an auto-run cartridge is present in the expansion slot, any "External Application" cartridges (See Sec. 3.3) plugged into the Expansion box will be disabled.

(e) The Auto-run cartridges conform to the EXTSEL/EXTENB protocol (have their own decoder).

(f) The Auto-run cartridges must disable their decoder if the "Auto-run Disable" output of the S-16 is active.

3.2 Parallel Bus Peripherals (PBPs)

The PBPs have the following characteristics:

(a) They interface to the S-16 through a well defined handler/O.S. interface. The code for this interface is resident in CPU memory location D600H to D7FFH (COMM A & COMM B areas). The ROM containing this code is physically located on the expansion box.

The S-16 O.S. can support up to 8 PBPs.

(b) Each PBP has a unique handler that resides in the CPU memory space at locations D800H to DFFFH. The ROM(s) containing the code for these handlers are physically resident on the respective peripheral boards (The memory space occupied by the handlers actually contains the Math-pak within the S-16. The Math-pak is disabled whenever any PBP is enabled. (See (c) below).

(c) Locations D1FDH thru D1FFH (in COMM C space) in the CPU memory map are reserved for passing control information between the S-16 and the PBPs.

Location D1FDH is Slot-Select location with the following bit assignments:

```
7 6 5 4 3 2 1 0
--------------------------------
| X | X | X | X | E | I | I | I |
```

```
---------------------------------
```

E = Enable bit. The S-16 sets this bit to logic 1 whenever the O.S. wishes to communicate with a device in the slot whose I.D. is specified by III. When the Enable bit is set to logic 1 the S-16 disables the Math-pak and maps the region from D800H to DFFFH to the expansion box. The Enable bit is latched in the expansion box and it must be set to logic "0" to disable the PBPs.

III = SLOT I.D. The S-16 O.S. can support a maximum of 8 PBPs. The slot I.D. is latched in the expansion box and a slot remains selected till a different slot I.D. is generated or the enable bit is set to logic 0.

X = Don't Care.

The Slot I.D. decoder is physically located on the expansion box. location D1FEH is Interrupt vector location with the following bit assignments:

```
7 6 5 4 3 2 1 0
---------------------------------
| X | X | X | X | IR | I | I | I |
---------------------------------
```

IR = Interrupt Request. This bit, when logic 1, indicates to the S-16 O.S. that a device in the Expansion box has interrupted. When this bit is logic 0, no device in the expansion box has interrupt.

III = is the slot I.D. of the highest priority slot that generates the interrupt. The S-16 O.S. assumes that the slots have fixed priority. The slot with an I.D. of 7 has the highest priority.

X = Don't Care.

The priority encoder is physically located on the expansion box. Location D1FFH is un-encoded interrupt location with the following bit assignments:

```
7 6 5 4 3 2 1 0
---------------------------------------
| I7 | I6 | I5 | I4 | I3 | I2 | I1 | I0 |
---------------------------------------
```

IX (X = 0 to 7): This bit is set to logic 1 whenever a device in slot X generates an interrupt. This bit is cleared by the interrupt servicing routine for the device in slot X.

The un-encoded interrupt location allows an application program to mask the interrupts from the specific slots. With the masking arrangement, an application program may ignore the fixed priority by slots and implement its own priority scheme.

(d) A peripheral handler may respond to address in the region D800H-DFFFH only when the slot in which it resides is selected. Location D800H contains the device I.D. of a PBP. If a slot that contains no peripheral is selected, address D800H should return FFH as data.

The peripheral handlers must conform to the EXTSEL/EXTENB protocol as specified in the S-16 Product Specifications.

(e) A peripheral may respond to address in the region D100H to D1FCH only when the slot in which it resides is selected.

(f) The PBPs will have priority over the SIO peripheral when they are addressed generically.

(g) The data between the S-16 and a PBP is passed under control of the peripheral handler for the PBPs.

(h) The PBPs will work if an auto-run cartridge or an internal cartridge is present in the system.

3.3 "External Application" Cartridges:

The External Application Cartridge are a generalization of the auto-run cartridges and the PBPs. They have the following characteristics:

(a) An "External Applications" Cartridge (EAC) can reside at any or all of the address in the region 4000H to BFFFH. They may respond to these addresses only when "opened".

(b) The EACs must be "opened" by the S-16 through the slot select location in the same way as the PBPs.

(c) The EACs must conform to the EXTENB/EXTSEL protocol.

(d) The EACs must have a "handler" (resident in locations D800H to DFFFH) that controls their operation. The EACs must conform to conditions (d) and (e) of section 3.2 above.

(e) The EACs will work only if no auto-run cartridge is enabled in the expansion box. The EACs must input the AUTO-RUN DISABLE line to ascertain that the Auto-run cartridge is disabled before asserting themselves on the Expansion Bus.

(f) The EACs may work even if a cartridge is present in the internal cartridge slot.

4.0 assumptions

(a) The above description of the PBI devices assumes that there is a mechanism in the Expansion Box that prevents more than one auto-run cartridge from being turned on at a time on the PBI. This mechanism may be a daisy chain priority scheme by slots or the auto-run cartridges may be specified to work in only one of the 8 possible slots.

(b) The above description also assumes that there is a power shut-off interlock switch on the internal cartridge door.

3872. Re: 80 columns and baud rate

Newsgroup: comp.sys.atari.8bit
Date: 1991-04-07 07:08:24 UTC
From: scale@abode.wciu.edu
Message-ID: <1991Apr7.070824.1236@abode.wciu.edu>
Source record: 114217

Good point! Yes BobTerm is perfect for high speed transfers. I have done both 9600 and 19.2k baud null modem transfers using BobTerm (the 19.2k is possible using an ICD Multi I/O). I believe the latest version of BobTerm is 1.21. Bye.....

Luis

Sure Bobterm can do 19.2k transfers, as long as nothing goes to the screen.
The only thing on the screen during a file transfer in Bobterm is the status
line which only changes a dozen bytes every 1k. Try a 19.2k or even 9600
ASCII capture and I bet it would lose characters reguardless of what display
mode it was using (40 or XEP80). Of course, I don't think you would lose
that many with Bobterm even at those speeds, since Bobterm is an excellent
program.

> not worth the effort (to the authors in any case).

I think the latter is the real problem.

The Atari display commands and display lists partition the screen into horizontal bands. This is a real pain for some applications, but it's perfect for scrolling. Just use one display command per line and scroll by updating the display list -- a very fast operation compared to moving all the bits on a gr.8 screen. I once modified a VT52 emulator written in ACTION! to use this technique and it easily kept up with 2400 baud. I believe Kermit65 uses the same technique.

A serious problem with an 80 x 24 display is that a standard Atari 8-bit doesn't provide enough pixels to allow a decent looking rendition of the character set, at least in my opinion. The VT52 program used characters that were quite legible on my monitor (a 1702) but had all the charm and grace of an OCR font. Perhaps that's why authors haven't worked very hard to support such displays.

How about somehow rigging a Hercules graphics board to the machine.

What would be good would be to produce a new upgrade to the Antic chip (Its the graphics ship, isn't it?), one that would have an 80 column mode, and patch the OS to be able to take advantage of this new graphics chip. This is what Atari should have done in the first place, instead of the XEP80.

BTW, could anyone recommend the best vt100 emulator for someone with a XM301 modem?

I did the same thing, and I have been using my modified version of
VT52B.ACT at 2400 baud for several years. There is no flow control,
but the R: handler that comes with the P:R: Connection has a 128-byte
buffer that helps. I have only recently discovered that the program
has trouble keeping up if lots of short lines are printed rapidly, but
I'm sure that the scrolling speed could be improved if it were really
necessary.

Source record: 114229

Hello again, Ray!

Regarding your questions about 80 columns, baud rate, and the graphics 0 and 8 screens: The graphics 0 screen uses just as many pixels as the graphics 8 screen (40 columns by 24 rows, each character being 8x8 pixels = 320 x 192). The big difference is that graphics 0 is a character mode. This means the OS only has to write to an array of 960 bytes (40 x 24), and Antic will display this as 61,440 pixels. Each byte is used to address the character set RAM (remember all those routines to redefine the character set in old magazine articles?), which contains the 8x8 pixel definition. In graphics 8, however, there are only 8 pixels per byte, and thus 7680 bytes (61,440/8) must be manipulated per screen. Because this is eight times as much memory to be manipulated, the terminal program will run eight times slower (1200 vs. 9600) (I don't believe how nicely that worked out).

Jeff

3879. Strange ANTIC anomaly

Newsgroup: comp.sys.atari.8bit
Date: 1991-04-08 13:43:51 UTC
From: aa384@cleveland.Freenet.Edu
Message-ID: <23136@know.pws.bull.com>
Source record: 114230

Recently, I tried to set up a custom display list which did the
following:

two lines text (gr.0)
blank scan line + interrupt
several lines text + interrupt at end
LMS to new text line + horizontal scrolling enable
LMS back to final line
wait for VBLANK

Problem: after the line with horizontal scrolling enabled, the
DL stopped processing. The last text line was not generated. I tried tweaking
other things, and got garbage after the line with horizontal scrolling.
I finally got it to work by dividing the last LMS line into an LMS with
a blank scan line and then a text mode line.

Can anyone tell me why this won't work normally? I don't want to
have to put that blank scan line in there if there is any way around it.

Also: could anyone direct me to an ftp site when an electronic copy
of De Re Atari could be found? I have heard of this being on some commercial
service, but I don't have accounts on any of those.

Thanks in advance!

>the Operating System listing.)
>
But to get any kind of speed better use the parallel port on the
ST and the (sadly overused) joystick ports and the serial port on the 8-bit.
I have something like this working and the hardware is simplicity itself just a
schmitt-trigger IC and two resistors (apart from the cables). Unfortunately
on the software side the ST is single-tasking, which takes some of the fun
away and my stab at making the ST multitask apparently fails with TOS 1.4,
although I haven't investigated that yet. If I get my head out of this
ocean of work to get some oxygen and maybe enough time to rewrite the server
for Micro RTX or MiNT I will release this stuff.

The server is unstable at the moment, meaning that you shouldn't try to
run programs while using the server on the ST.

Just to brag a little, this can be done:

N: device handler 98% SpartaDOS eq.
with SpartaDOS 2.X, you can do stuff like
D1: N: # typed from memory, syntax maybe not 100% correct
N: DIR
N: CWD N:E:/FOOBLE>BAR\TMP
N: COPY TMP/BIGFILE.DAT D8:
N: COPY D8:BIGFILE.DAT N:TMP
N: CREDIR LILO

Transferring DEGELITE.PRG (approx 150K) takes not much more than 15 sec
from RAMdisk to RAMdisk.

If you don't mind occasional crashes, I could send interested parties
the prototype server and device driver software (binaries only, sorry).
Beats any Null modem transfer anytime, anyway!

Email to : XBR1DE7B@DDATH21.BITNET

Ah, yes and asking this for maybe the tenth time... "How does one write
a device driver for the X cartridge ?"

The interface BTW looks like this:

```
------- port a
------<<<>>>---------------- parallel port ST ----
------- port b

------- IRQ Pin 13 SIO ---------<<<------- Strobe Centronics ----

------- Motor Pin 7or8 SIO -->>>-- 1K --+-[IC]-- Busy Centronics -
|
1K
|
Ground
```

As you may be able to tell, this makes using the tape recorder impossible.
TOO BAD! (har har)

Nat!
"If there's a new way, I'll be the first in line/But it better work this time"

3883. Atariwriter Rules! (Or "How to do Mail-merge with Atariwriter!")

Newsgroup: comp.sys.atari.8bit
Date: 1991-04-08 18:55:37 UTC
From: rlcollins@miavx1.acs.muohio.edu
Message-ID: <4742.28007659@miavx1.acs.muohio.edu>
Source record: 114235

I was at my girlfriends house this past weekend helping her send out letters for applications. (She's graduating in August) Anyway, she has me old 800xl, which she uses to type her papers and send E-mail to me. (Since we're 120 miles aprt) Anyway, we needed to address 77 different envelopes and 77 different personalized letters with Atariwriter. I had remembered an undocumented feature of Atariwriter in an old Antic in which Atariwriter could do some sort of mail merge. But I didn't have the magazine with me, so I had to figure it out on my own. Here it is:

o Create you form letter (envelope):
1. In your top line with the formatting commands, add the <cntrl>W if your are doing single sheets and want it to pause after each page.
2. Put an <OPTION><INSERT> whenever you wanted to bring new information into the letter (envelope), just like it says in the manual for form printing.

o Create a file with the information you want merged in your letter (envelope). For the envelope we wanted to add addresses so the file looked like this:

```
The ABC Company
Mr. Webster, President
123 Alpha Way
Nowhere, USA 12345
<--- I had a space in here in case an
The ABC Company address had five lines, it also helped
Mr. Webster, President readability of the file. Just be sure
123 Alpha Way in you form letter (envelope) you have
Nowhere, USA 12345 five lines.
```

o Save that and load in your form letter (envelope). Load you printer with paper (or an envelope) and print your form letter (envelope). When
Atariwriter says:
Make Entry, Press RETURN

press <cntrl>V and then enter the filename.ext of you information file. Atariwriter won't give you any indication that you did this correctly, but after you enter the filename, it will get the file off of disk, and put the information in place of the <OPTION><INSERT>s. For the number of copies, you must specify how many different sets of information is in you file. You can't just start printing from the middle of your information file.

This worked perfectly, much better than I would have ever thought it would, and it did it just as well as my ST could've. This just goes to show that

the 8bits aren't dead, and will probably be around for a lot longer!

3884. Finance programs question

Newsgroup: comp.sys.atari.8bit
Date: 1991-04-08 21:04:31 UTC
From: dave@mystie.webo.dg.com
Message-ID: <1991Apr8.210431.12867@webo.dg.com>
Source record: 114242

Hi!

I'm looking for a finance program for my XEGS (64k) - with a
Indus GT disk (and a PR connection with an epson printer...).

I'd like the program to be able to do the following:
Checking account
Several Savings accounts (three actually)
Credit card accounts (a couple) - where if I write a check
to pay one, I'd really like the payment shown in both the
checking account and the credit card account.
It'd be nice if it could print checks and mailing labels
(or at least have a way to export data to some other program
that could do this for me).
If I have to export the data (and can), what would be a good
program to print the checks/mailing labels from? AtariWriter?
What other word processors are there?

Is there such a program?

All I've seen the following names in Atari Explorer without
descriptions:
Bookkeeper/Keypad
Home Accountant
Money Manager
Family Finance
Money Tools
Financial Cookbook - I'm guessing this is a program from
EA where you have a menu of a lot of financial problems
and you select which you need a solution for - it did things
like loan payments over X years and lots of other problems.

Will any of these programs do what I want?

Well, I've been thinking about this 8bit <-> ST connection thing, so I might end up doing it. (After I get my old 400 from home.) Anyway, I would like to implement it in a way that is transparent for the 8bit, so that when it makes an access to D:, it will go to my ST instead. The only problem is that I don't know the commands that a disk drive is supposed to recognize, so if anyone has these lying around, could they send me a copy.

p.s. I'm also going to be looking into the SIO2PC stuff, and see how they do it, since I want to do basically the same thing, except do it in the background on my ST so I could still use it as normal.

NOPE! BT 1.22 is out, but its just for people who had trouble with
the dialing in 1.21. 1.21 was the same as 1.20 but it added a driver
for xep80..

theres really been no significant changes since 1.20 came out in the
program other than the driver for xep.

For that matter id like to know what the rs232 register should be set
at. Im using a MIO with this thing and it gives me the error codes
that my pal (using an 850) gets when he CONNECTS with the 850 off.
What would the register have to be set at!?!?!
$WHAT?

3892. 800XL SIO cables wanted

Newsgroup: comp.sys.atari.8bit
Date: 1991-04-11 03:07:45 UTC
From: den@hpfcso.FC.HP.COM
Message-ID: <9360005@hpfcso.FC.HP.COM>
Source record: 114249

I am looking for some short SIO cables for an Atari 800XL. These are
the 13-pin cables used to connect disk drives, etc. I have several
3-foot cables and need several shorter ones. I'll pay $10 each for
two cables. I'll also consider shortening longer cables.

These are for debugging the SIO2PC hardware which is flaky right
now. I want to see if shorter cables helps as it works most of the time.

3893. Copy Protection Scheme

Newsgroup: comp.sys.atari.8bit
Date: 1991-04-11 11:59:58 UTC
From: simonh@hpopd.pwd.hp.com
Message-ID: <40060005@hpopd.pwd.hp.com>
Source record: 114250

Over the last few evenings, I have been trying to discover how the copy protection works on one of the disk-based games I have. The game loads itself in several stages, to display a title screen whilst the rest of the program loads...

Using a monitor/disassembler program, which allows you to read/write selected disk sectors to a specified buffer, I eventually disassembled enough code to discover how the program loaded itself in. Apart from the usual "unformatted sectors" method, the program used a really neat trick which goes something like this:

```
:
: (set colours & display list pointers etc.)
:
* Read Sector <N> into buffer [$600-$67F]
* Read the SAME Sector into buffer [$680-$7FF]
* For X = #$00 to #$7F do..
* EOR $600,X with $680,X and store in $2800,X
:
: (more stuff)
:
* JSR $2800
:
```

The point is, on a normal disk (ie. a "copy" of the original) the values loaded into the destination buffer [$2800-$287F] all equal #$00, since

<n> EOR <n> = #$00

so the JSR encounters the BRK instruction and stops. However, on closer inspection of the original disk, I discovered that reading sector <N> several times in a row produced one of TWO sets of data in the buffer. When I EOR'd the two sets of data together and disassembled the result, there was the "missing" subroutine.

Does anyone know how the disk was manufactured such that reading the same sector gave TWO different, but CONSISTANT, sets of data?

Observations:
1. The two sets of data NEED to be consistant to produce the correct code when EOR'd together.
2. It doesn't matter which order the data sets arrive in as EOR is commutative.
3. Reading the sector several times did not guarantee alternation of the two data sets.
4. There wasn't any provision for checking that the second read of the

sector had produced the OTHER data set.

What puzzles me is 3. and 4. Together they seem to imply that occasionally, two consecutive reads of the sector would produce the same result which when EOR'd together would, of course, produce a zero filled buffer. This in turn would halt the program with the JSR call. However, in the numerous times I have loaded and played the game in the past, I have NEVER seen this happen.. it's always loaded fine.

Any ideas?

Simon Hunt.

Excellent hack work Simon. I did this on Choplifter way back in 1981.
Very difficult to figure out when I never knew more than one sector
could have the same sector number. (10th grade == not very bright :-)

>Observations:
> 1. The two sets of data NEED to be consistant to produce the correct code
> when EOR'd together.
> 2. It doesn't matter which order the data sets arrive in as EOR is

>
Correct.

> 3. Reading the sector several times did not guarantee alternation of the
> two data sets.
>
If you read them with a sector editor, of course not. However, if read
in rapid succesion by an assembly program, the computer generates the
first read. It is satisfied as soon as a sector with the correct number
passes under the disk drive head. Then, immediately ask for the same
sector again. The computer will send the request to the disk drive before
the other sector with the same number passes under the head, and now
the disk drive will satisfy the read request with the other sector.

> 4. There wasn't any provision for checking that the second read of the
> sector had produced the OTHER data set.
>
Not needed because the way the sectors are read in guarantees
the correct data.

>What puzzles me is 3. and 4. Together they seem to imply that occasionally,

>
Choplifter used a slightly different scheme, if I remember correctly.
It seems that three sectors had the same number. The loading routine
would read the same sector 10 times into two different locations
alternatively. Some how, this produced the correct data in the right
locations. I never figured out why. Anyway, I copied the two
neccesary sectors to two DIFFERENT sectors on my copy, changed the loader
to read one sector into one location, and the other sector into another,
and jump to it. Luckily, the boot loader didn't checksum itself before
running the program. I believe that Way Out did this. Made it a little more
difficult to hack. Of course, now that I have a Happy Drive, backups
aren't so difficult!

This is a very old copy protection scheme that relies on some timing properties of disk drives. Consider a single track of data which contains 18 sectors. These are normally numbered from 0 to 17 but are NOT in order around the disk surface. I forget what the optimal format is but basically, sector 1 is almost 180 degrees around the disk from sector 0 and then sector 2 is almost 180 degrees from sector 1, etc. This is because while the computer and disk drive transfer the data across the SIO cable, the disk is still spinning and it just so happens that it is almost 180 degrees later when the drive and computer are ready to read the next sector.

Now, in the case you mention above, if you labeled two sectors with the same sector number in a track, which one you got would now depend on the timing of other reads around you. Various methods have used the idea that if you read the sectors in the order of say 0 - 1 - 3 - 1, then you got two different reads for sector 1. With what you describe, they are counting on the following fact: If I read a sector "1" from the track and immediately read another sector "1" from the track and these two sector "1"s are approx 180 degrees apart, I am all but guaranteed that I will get two different sets of data, ie., I will read both of the sector "1"s on the disk. As to how they did it, it is simply a matter of reprogramming the drive (not possible on a stock 810 or 1050) to format the disk in a different manner than the normal way. It turns out that Happy enhanced drives have been able to do

this for some time and have absolutely no problem duplicating the format on the destination disk.

By the way, you probably do not really have as many "unformatted" sectors as you think since if you have 18 sectors and renumber one of them to be a duplicate number, one of the 18 sector numbers will not exist so the drive will treat it as if it were unformatted.

I am in need of a job, and hopefully something dealing with computers and/or general office/clerical type work. Here's my resume

RESUME

NAME: Phillip R. Keen SOCIAL SECURITY NO.: 457-57-4650
ADDRESS: 2705 Martin I.D. NO. : 02797658
Pasadena, TX 77502 DATE OF BIRTH: May 27, 1970
PHONE: (713)-946-5284 AGE: 20 SEX: Male RACE: White

EDUCATION:

GRAMMAR: Fisher Elementary Park View Intermediate
2220 Grunewald 3003 Dabney
Pasadena, TX 77502 Pasadena, TX 77502
1976 to 1982 1982 to 1985
(713)-944-6999 (713)-944-0734

HIGH: Sam Rayburn High School
2121 Cherrybrook
Pasadena, TX 77502
1985 to 1989
Graduated: June 7, 1989 with a High School Diploma.

COLLEGE: San Jacinto College - Central Campus
8060 Spencer Hwy.
Pasadena, TX 77505
September 1989 to December 1989
(713)-476-1838

SCHOOL NOTES: Although I did not do to well in college, in the spring/summer of 1989, I had all kinds of tests done through the Texas Rehabilitation Commission (TRC). These tests showed that I was more vocational inclined than academically inclined.

Goodwill Industries Supervisor: Linda Mark
P.O. Box 21185 Phone: (713)-692-6221
5200 Jensen Drive May 9, 1990 to whenever hired.
Houston, TX 77026

The training out here at the Goodwill, is vocational training. So, it is more like on-the-job training than anything, because I am being paid a small amount while working, but yet I am also getting trained at the same

time. My goals for Goodwill are
To develop job search, interviewing, and
retention skills.
To assist in vocational exploration
To develop appropriate socialization skills
To build confidence and maturity
To attend work daily and to be punctual
To learn to follow directions and rules
To learn a job skills
I started out making $0.45 per hour, now I am making
$3.80 per hour. Because of the nature that Goodwill
is, the maximum trainees can make is $3.80 per hour.
My training will terminate at Goodwill when I am
hired on with another company. The job skills I
have learned while at Goodwill are office/clerical
work and skills.

Mitchelo's Pizza, Pasta, and More
1900-A Strawberry
Pasadena, TX 77502
(713)-473-8200
SuperVisor: Mitch
May 3, 1987 to May 23, 1987

I was a kitchen helper and a bus boy. The
goals were for me to help around the kitchen
and clean and clear off the tables after people
were done eating. I had to quit so soon though,
because there simply were not enough customers to
keep me on. I was not the only person who was
laid off at the time.

SPECIAL SKILLS:

I have been working with computers now for about 13 years.
Everything I know about computers, I have basically taught
myself. However, in High School, I was in a couple of
computer classes, and in college I took a computer class.
Although I have not been in working environments with
computers, the information I have learned, I have learned
on my spare time at home. I know how to use just about
any computer system out there, and just about ALL software
If I don't know how to do something with the computer, I
can easily learn it, and generally quite quickly.

DISABILITIES:

I have a slight vision problem. I do not have that
much problems with my vision, unless I am in a very
dim lighted area, and occassionally some small
print is hard for me to read. Whatever I have
been told to do, I WILL accomplish, although some

things I might be slower at doing than others. I have problems with my asthma, and need an inhaler or my breathing machine some. Most of the time at home I use the breathing machine, but at work, I can bring an inhaler when I need it. I also have problems with allergies. Due to my allergies, my nose is stopped up 90% of the time, resulting in me breathing through my mouth most of the time. In return, it dries out my mouth and requires me to need something to drink more than normal. I will make do though, on what my working environment consists of though. The one thing I absolutely CANNOT have is anything with PEANUTS. PEANUTS or anything with PEANUTS make me severely sick.

EMERGENCY:

In case of an emergency, you can notify Mr. or Mrs. B.G. Keen at the same phone number as is listed for me, or my Dad, Mr. B.G. Keen at work (713)-644-1206.

I would guess all that's involved is converting the Atari bus over to an IBM bus. There may be problems with timing though.

As for thankless, probably. At least you get 80x25 text and 7?? x 3?? graphics. Too bad I can't change the OS on my 800.

Hi Phillip,
About running your own BBS. It can be a real pain in the axx
(well... you know!); while occassionally it also has it's rewards. To "do it
right", you will need a few basics; a computer just for the BBS (not one that
you "share" with the BBS part-time), a hard drive and a 2400 bps modem (any
slower a modem, and many users won't even call!). Any of the three computers
you mentioned (an Atari 800XL/130XE, Atari ST or an Apple IIx) would work great
for running a BBS. Which one to use really depends on if you have a spare one
of these lying around unused, or can acquire for the least amount of money, or
have a preference for a specific BBS software. Look around, the style of BBS
YOU like and which computer you can afford to setup, will be factors.
As for the Atari 8-Bits, there are really only two realistic choices
for BBS software; BBS Express Professional and Carina II (2.5). Both the
SysOp's of CII and Pro love to flame each other over which one is better, but
both are excellent systems as each as both advantages and disadvantages.
Both CII and Pro have networking, capable message editors and U/D
sections. Also online games and databases. No matter what anyone tells you
(gee... does this include me? :^)), niether one is "better" than the other.
Now of course, I have my personal preference; but then I have been
running CII for three years now (was that subtle or what?!). For CII "looks &
feels" the way I want my BBS to "look & feel". It is written in BASIC, so I
can modify (easily!) to my heart's content; both BASIC and SpartaDOS are
available remotely so I modify from anywhere while I am out of town. In three
years CII has never crashed (although the MIO did go POP during a heat wave!),
CII can be safely called "bullet-proof".
Pro has many of these features too, although I am not as knowledgable
about Pro as I am about CII. Hopefully someone here on the net is a Pro SysOp
and can give you (and all of us) more insight into the workings of BBS Express
Professional. I hope this helps, bye.............

Without question the best BBS I have ever seen - on any system, is
Morgan Davis' ProLine system for the Apple II. I run it on a IIe
suped up with an 8mhz zip chip. It runs for weeks sometime without
my paying any attention to it. It supports Usenet newsfeeds and
outside email connections, the software upgrades arrive electronicly
via remote copies, the code is almost all in AppleSoft basic, which
makes bug fixes and additiions relatively straightforward. And to
top it off the environment includes a large portion of Unix-style
commands and a cshell subset. You can get more info from
mdavis@pro-sol.cts.com (...crash!pnet01!pro-sol!mdavis).

3906. WordProcessors query.

Newsgroup: comp.sys.atari.8bit
Date: 1991-04-15 21:33:39 UTC
From: jbanner@sol.uvic.ca
Message-ID: <1991Apr15.213339.14149@sol.UVic.CA>
Source record: 114183

Hello, a freind of mine just recently got an atari (I don't even know what kind, except I know it is not in the ST line), and very shortly there after had to replace the printer. Unfortunately, the WordProcessor that came with the machine doesn't support the new printer he got (I don't even remember which printer, helpfull aren't I :-). Anyhow, now he is looking for a new WordProcessor that will deal with his printer, and as I am the local computer wiz, the task fell to me... So, knowing nothing, I am asking for help from the best place I can think of. Does anyone have any suggestions? Are there any available by FTP from somewhere (and if so, how would I get it onto a disk for him?). If there are commercial suggestions, what sort of a price range are we looking at (we are looking fairly low budget I understand).

Thanks in advance,

S. John Banner

>Without question the best BBS I have ever seen - on any system, is
>Morgan Davis' ProLine system for the Apple II. I run it on a IIe

I've never seen ProLine, so I can't comment on it, but I really
think GBBS is a really good BBS system from using it. (And I've read a lot
of the info on it because I was going to write a full-screen editor for one
but unfortunately there are no arrays in the language it uses)

I've pretty much gotten out of the microcomputer BBSes though, except
for getting new programs..

UNIX, cshell, the Internet and UseNet just seem to be a new dimension
in modemming... non-networked (or minimally networked) BBSes just seem
so "small."

Yeah, I realize ProLine can get a UseNet feed.

A pretty neat BBS for MSDOS systems (and it runs under UNIX too)
is waffle. If anyone's interested in an Apple II version of it, send mail
to root@darkside.com

I've wanted to port that program for a long time or have them port
it as it's pretty good (they won't let me port it, but maybe sufficient
outside interest will help it happen).

After recently getting hold of an Atari 8-bit replacement CPU - Turbo 816 - at a bargain second-hand price, I'm very interested in obtaining details of the manufacturers, or any other information relating to the device generally.

I do believe it is a Canadian product, though I'm not sure if the company is still in existance. Any help on the matter would be greatly appreciated. Email only please. Ta!

3912. 8 bit stuff for sale

Message-ID: <1991Apr16.151012.3769@philabs.philips.com>
Source record: 114161

I find that I don't have time for working on the ol' 8 bit
so the following Atari stuff is available:

- 130 XE computer

- 1027 LQ printer

- 1050 disk drives; quan. two (2)

- printer interface to Centronics

- the usual bunch of books, some software, etc.

All the units are in the original cartons and include
original power supplies, cables, manuals. The disk drives
and the printer are in good operating condition. The 130XE
will need some work: it has sporadically shown a thermal (?)
problem - will occasionally sprinkle a few random characters
on the screen after it has been turned on for a while.

Would prefer to sell the items as a complete package; $160,
shipping not included.

- email philabs or: 914-945-6230 (weekdays)
203-354-1597 (eves. / weekends EDT)

larry (WA1ZSQ)...

Waffle started out as an Apple][BBS, if you want to know the truth.
Tom still has a copy of the old Apple version, but it is not where he
can get to it quickly or easily (200 mile drive one way...). The best
address to get him at for Waffle related material is dell@vox.darkside.com
as he gets to that more often than the other (or at least answers stuff
faster from that address). He really has no interest in getting the
Apple version current. There is no decent C copiler for the Apple][line,
so it would have to be a separate product. It is mostly in assembly,
with a little BASIC thrown in and not something most people could deal
with making changes in.

BTW, Matt. Tom does remember you...

>
> Hi Phillip,
> <quoted text deleted>

Yes, I know it does. See, that's the problem now with the IBM is that I am needing to use the computer more and more while the BBS is up. So, that's why I am looking into getting a dedicated machine, and I named my options, because my options are the cheapest around town here. I am most likely going to go with the Atari 8-bit because I like how well BBS Express Pro supports ANSI graphics. See, all three types of systems (Atari 8-bit, Atari ST and Apple][x cost right around the same amount here in town with Apple][x being the most expensive, the Atari ST being the next higher priced, and the Atari 8-bit being the lowest). However, I suffer the consequences with the Atari 8-bit systems, and that is I would have to be buying ALL used equipment. If I were at least able to purchase Apple][x or Atari ST systems, I would be able to purchase it all new. So, I don't know which route I should go. See, I am happy with most everything I see in operation, so it makes decisions hard on me. This is why I brought the conversation to such a huge network community, to kind of help me decide which route to go.

Yes, thanks for the information about Carina II, although down here in Houston, BBS Express Pro is the preferred BBS package amongst Atari 8-bit computer systems. I might just give a Carina II system a call sometime. The Carina II system in town, NiteLight has been having some problems, so I might have to call out of town or something. There is one Atari BBS program I wasn't too happy with, but don't remember what it was because it's been ages ago since I've seen it. It might of been Carina for all I know. I'll have to check them out again... Phillip

Well, true many people thing UNIX, cshell, and the internet and USENET
just seem to be a new dimension in modeming. I see that, but I just simply
do not have the money to upgrade. That is my plans eventually is to
start my own public access UNIX system and focus on education with it, but
until that time, I am looking at cheaper alternatives.

Yeh, Waffle is a pretty good ol' program. It's not as fancy as it could
and should be for DOS. It would be great if the DOS version would support
color ANSI graphics. If it did, I would stay with it. That's why I am
wanting to switch programs, is my users are complaining about the all text
based WAFFLE. Phillip

Hi Craig,
Without a doubt... none of the Carina (I or II) BBS programs
are public domain, they are commercial programs available now from Shadow
Software. Carina was sold to Shadow Software last winter. Version 2.5 will be
released later this week, it will cost $50 for new SysOp's. If anyone out
there bought Carina from Jerry Horanoff, but has not re-registered with Shadow
Software, should contact the following:

Shadow Software
8023 N. Berkeley
Portland, OR 97203

Attn: David Hunt
503/286-6276 Voice
503/285-4417 Carina Support BBS

I hope this helps anyone who has questions about where to get Carina
or re-register for support. Bye.....

Luis

You know...it has just occurred to me that the 8-bit would be the absolute
cheapest way to go... There is a new program/cable combo out that allows the
Atari to use the IBM as a fileserver. Presumably this doesn't force the
IBM into a dedicated mode. If you bought an 8-bit, a 1050 (or better),
the BBS program of your choice, and the SIO2PC program/cable, you'd probably
pay about half of what it would cost you for a different system.

If you're interested, I'll try to dig up the reference to the SIO2PC stuff.

3923. BBS listing

Newsgroup: comp.sys.atari.8bit
Date: 1991-04-18 04:11:33 UTC
From: fseipel@magnus.acs.ohio-state.edu
Message-ID: <1991Apr18.041133.14695@magnus.acs.ohio-state.edu>
Source record: 114177

I figured I would post this since it is hard to find BBS's that support the
8-bits. I got the file from Computer Software Service's BBS.
(see below for BBS listing)

I also had a question for the netters: I am still relatively new to UNIX.
I wish to put Usenet newsgroups on my 8-bit BBS's. I don't think anybody's
tried this before (if anybody has, please e-mail me!). I can handle the 8-
bit end of it, but am totally lost on the UNIX side. I used to run a network
of Carina I boards many years ago, so I understand in general how I want to
do it, but need some help. Namely, how do I:

Post a news message to a given group, from a file which has been uploaded
with, say, X-Modem 1K. The name in the From: line must somehow be changed
to the BBS user leaving the message, so e-mail will get to the right user
on the BBS. I have the same question regarding sending mail and am quite
lost on reading mail. As far as x-ferring messages, I have that completely
figured out: I will use fgrep on the active file to determine the highest
message in a given newsgroup, then send each 'new' file directly from the news
directory with X-Modem 1K or y-batch.

3924. 64k mod for 600XL

Newsgroup: comp.sys.atari.8bit
Date: 1991-04-18 05:38:12 UTC
From: v104nmym@ubvmsb.cc.buffalo.edu
Message-ID: <71574@eerie.acsu.Buffalo.EDU>
Source record: 114174

A few years back, I bought a upgrade kit for the 600XL which
consisted of two chips which replaced the on board 16K rams
and a bunch of jumpers to rewire the MMU. I replaced the
chips , but shortly afterwards I lost the jumpers and instructions.

Has anyone done this mod before, and either remember what pins to
connect the jumpers between, or do you still have the instructions
from a kit you might have purchased?
any help would be appreciated.
Thanks in advance.

Sherm

3925. Re: Turbo-816 (a price/product guide) LONG

mike@mgc.uucp (Michael Blenkiron) writes:

>After recently getting hold of an Atari 8-bit replacement
>CPU - Turbo 816 - at a bargain second-hand price, I'm very
>interested in obtaining details of the manufacturers, or any
>other information relating to the device generally.

Well, in case anyone else is wondering about this product, or other products from Dataque. Here's a current price sheet direct from Dataque via GEnie. If you look hard enough at this list, you will notice they are developing a C compiler for the 8-bit (Look down this article about 3/4 of the way).

Send me no questions, I'm only posting in case someone is interested they can look for themselves.

```
==========================================================================

--------------------------------------------------------------------------
From: DataQue Software GEnie: DataQue.1 (Daily)
Post Office Box 134 Compuserve: 71777,3223 (Weekly)
Ontario, OH 44862 DELPHI: DataQue (Daily)
Subj: Product Information Release #91.04 April 1991
--------------------------------------------------------------------------
There are several new products in this release, some of which are
still in development. They are listed here, mainly to let you know
that there ARE products still available for the Atari Classic
computers.

Starting with this release, a simplified pricing structure has been
implemented. All prices are shown in US Dollars, for end user
purchases. See company policy at the end of this file for more
information on the ordering procedures.

--------------------------------------------------------------------------
Mono-Video 80:
--------------------------------------------------------------------------
This product is a 80 column monochrome video adapter which connects
to the computer using the PBI connector. With 130XE computers you
will need a bus adapter, available from ICD, Inc. for approx $20.

The MV80 will connect to either a composite, or TTL CGA type
monitor. All needed software drivers for 80 column, and 40 column
emulation are included in ROM on the card. Multiple character sets
are available via software control. The MV80 is a text device
only, so only the E: device is modified... The S: device is still
routed to ANTIC/GTIA. More information will be made available when
the product is shipping.
```

MV80A Monochrome 80 Column Adapter ** ESTIMATED ** Cost $100.00

*** Specifications and prices listed are projected and are subject to change.
Final specifications will be released when the product is available.
This is projected to be available 3Q '91.

Turbo-816:

The Turbo-816x is a 16-bit CPU upgrade for the Atari XL/XE
computer. This upgrade will add 16-bit working registers, a 24-bit
address bus, and numerous new addressing modes and instructions.
All this new power is available to new programs written to take
advantage of the new CPU, while maximum compatibility with current
hardware, and software is maintained.

Included with the Turbo-816x is a new operating system PROM, which
can be installed to replace your current Atari OS, or using a
switch circuit, used in addition to the Atari OS. This OS chip,
called the Turbo-OS provides system calls to take advantage of the
new processor addressing.

The Turbo-816x is clocked at the same speed as the original Atari
CPU, so that current games and such will run at approximately the
same speed as with the stock CPU. Since the OS, Interrupts, and
Floating Point package are more efficient than the stock OS,
existing applications will realize a speed increase of 5-10% in
addition to an increase that is proportional to their OS system
call usage.

The Turbo-816x comes packaged with the following:

- Turbo-816 adapter board for the XL/XE computer systems.
- Turbo-OS Operating System 28-pin PROM (2 for 1200XL).
- CPU ribbon cable with connectors.
- Installation guide.

Included also are the following files on SSSD disk:

Turbo-816 expansion bus pinout.
Turbo-816 MAC/65 compatible macros for 65816 instructions.
Turbo-OS MAC/65 compatible include file.
Turbo-OS to Atari 400/800/XL/XE OS cross-ref guide.
Turbo-OS function call application information.
Turbo-OS memory map guide, menu features, and several example files.

T816X-K Turbo-816 Kit Cost $110.00

Turbo-816 for the XL/XE computers. Includes adapter
board, connection cable, Turbo-OS PROM, installation and
usage guide, programming information diskettes. Please
indicate which system (600xl, 800xl, 130xe, or 65xe).
To make room for added features the international
character set, and cassette device handler have been

removed from all versions of the Turbo-OS. Installing
the Dual-Prom option will allow use of the Atari OS in
applications where those features are desired.

T816X12-K Turbo-816 for 1200XL Cost $130.00

Same as XL/XE kit, except includes two PROMs for the
1200XL. Note: 1200XL function keys and lights are not
supported.

T816IND Installation w/Dual Prom Option Cost $45.00
T816I12D1 Installation into 1200XL (w/800XL Atari OS) Cost $70.00
T816I12D2 Installation into 1200XL (w/1200XL Atari OS) Cost $65.00

Includes installation of a Turbo-816 into an Atari 8-bit
computer. Units will be tested before the installation,
and will not be modified if the unit does not pass all
tests. Price includes any needed sockets, wire and
toggle switch. Installations usually have a three to
four day turn-around except 1200XL I12D1, which may take
longer. Please provide name, address, phone number AND
sufficient return postage.

TOS08 Turbo-OS PROM $12.00 Upgrade OS to 1.311
TOS08UG Turbo-OS PROM $22.00 Upgrade OS, and T816 board to 1.5

Upgrade/replacement Turbo-OS PROM of the current version
for the 600XL, 800XL, 130XE, 65XE or single PROM 1200XL.
Use 'UG' suffix for upgrading T816 and OS to current
version. You must return your T816 board for board
upgrades.

T816-OSW Turbo-OS source listing Cost $200.00

Turbo-OS listing includes a list file of the current
version of the Turbo-OS. It is available only as a
listing file. A signed non-disclosure form,must be
included with the order. Write for more information.
This is not for resale, and must be purchased directly
by the developer. Purchase does not grant any usage
rights to the information contained within, other than
for writing compatible applications. Available on
either Atari DOS 2.x, or MS-DOS formats.

PROGRAMMER'S PAL:

This program allows BASIC programmers to have reference data close
by while they are programming. This version is designed for DOS
2.x and compatibles. Among the functions included are:

Muliple CROSS-REFERENCE, BASIC CURRENT STATUS, CALCULATOR, DISK SECTOR
LOADER, MEMORY PEEKER, and OPERATING SYSTEM EQUATE.

PRG-PAL1 Programmer's PAL Cost $20.00
PRG-SRC1 Source code for Programmer's PAL Cost $30.00

Turbo-SRAM/PROM:

These boards will hold two memory devices. Supported types are 62256 (32k SRAM), 66204 (128k SRAM), 27256 (32k EPROM), 27512 (64k EPROM), and 27010 (128k EPROM). Information to configure the card for other devices is supplied. Both devices should be the same size, although you may have one SRAM device, and one PROM device.

Turbo-SRAM boards include a shunt selection guide, connection cable, protection sheath, and memory as specified by the part number suffix. The cable included will support one memory card. Turbo-SRAM is available without any installed RAM, 64k or SRAM, or 128k of SRAM.

TSRAM-0 0k Turbo-SRAM Cost $35.00
TSRAM-64 64k Turbo-SRAM Cost $50.00
TSRAM-128 128k Turbo-SRAM Cost $70.00
TSRAM-256 256k Turbo-SRAM Cost $99.00

Turbo-Calc:

Turbo-Calc is a cartridged based spreadsheet program for the Atari 800/XL/XE/XEGS/T816 systems. It will work with, or without a Turbo-816 installed. The Turbo-816 is required to allow access to expanded RAM. Turbo-Calc supports up to 104 columns and 99 rows of information.

Source code for Turbo-Calc is also available seperately, Please specify either MS-DOS, or Atari DOS disk format, and whether you want 5.25" or 3.5" floppies. The Turbo-View environment is not included in this source code package (see Turbo-View).

T816-S16 Turbo-Calc Cost $30.00
T816-S16S Turbo-Calc Source Code Listing (w/o Turbo-View) Cost $20.00

Turbo-View:

Turbo-View is a graphical operating environment, which uses the graphics 0 (antic 2) mode. The source code supplied contains the windowing routines, and execution control algorithms. Supplied also is the Turbo-View module of the Turbo-Calc program, to show an actual example of its use. Purchase of source allows use in non-commercial programs.

T816-V16S Turbo-View source code (non-commercial use) Cost $30.00

Turbo-A8:

This is an assembler which will run on any 8-bit Atari computer,
and generate either 6502, or 65816 object code. There is also an
extended version for systems which have XE banked type upgrades.
This was written by Jeff Williams of Canada, and coined as the Alf
Assembler.

T816-A8 Alf-Assembler for 6502/65816 Cost $20.00

TC8 *** availability to be announced ***

This is the high level language system you have been waiting for.
The C language is THE most popular language on large systems, and
now you can also develop complex programs using C, without paying
the severe code size, and speed penalties that 'other' high level
languages for the Atari 8-bit have demanded.

TC8 will be distributed on a bank selected cartridge, to allow all
the features of the ANSI C language. Not a small subset, but the
real thing. A full function library will also included on disk, to
allow users to make changes to system functions. Library source
will be offered seperately.

The system will have an integrated environment, which includes an
editor, C compiler, assembler, linker, and librarian. Other possible
utilities which *may* be included are: A profiler, symbolic debugger,
make utility, and project manager.

TC8DC Turbo-C8 Developer Cartridge ** ESTIMATED ** Cost $55.00

*** Specifications and prices listed are projected and are subject to change.
Final specifications will be released when the product is available.
This is projected to be available 3Q '91.

TBC-4000 *** availability to be announced ***

The TBC-4000 is a bank selected cartridge for all Atari 8-bit computer
systems. Many users have requested the availability of an easy to
use banked cartridge, and here it is!

The TBC-4000 has a socket for one JEDEC memory device. This can be any
EPROM from 2764 (8K byte) through 274000 (512K byte). There is an
option socket for an 8-pin EEPROM (Electrically Eraseable EPROM). This
can be used to store user programmed defaults. There are several of
these EEPROMS available, from 256 bits, through 4K bits.

To simplify programming, the TBC-4000 forces bank-0 into the upper
half of the cartridge (4K bytes) at all times. This removes the hassle
of recalculating the cartridge checksum on the XL/XE's each time the
bank is changed. Also, bank-0 will always be the bank entered through
the OS system reset/init, so you do not have to duplicate that code

in each bank. Since this bank is always accessible, your bank switching and other often used subroutines can be located here for optimum performance. The lower 4K of the cartridge will power up randomly, so your bank-0 init code will have to initialize the select register.

The price below does NOT include any EPROM or EEPROM memory device, and is for low volume (under 25) purchases.

TBC-4000 Banked Program Cartrige ** ESTIMATED COST UNDER $17.00

*** Specifications and prices listed are projected and are subject to change. Final specifications will be released when the product is available. This is projected to be available 3Q '91.

MSDOS Cross-Development Products for the Atari 8-bit Systems:

The following products are available for those programmers which have access to a IBM/PC or compatible computer, and would like to be able to develop code for their Atari 8-bit (and Turbo-816) systems.

These programs require a minimum of 256K of available RAM, and either MSDOS or PCDOS, version 3.0 or higher. They will all work on 8088 through 80386 based machines. A hard drive is recommended.

The X816 assembler will produce code in either binary image (for EPROMS) or Atari binary load format. Extended Turbo-816 object format is also supported for images which are to be loaded above the normal 6502 addressing range.

X816 cross-assembler for 6502/65816 Cost $20.00

D816 will accept either of the two binary forms for input, in addition it will accept the link file produced by X816 (or you can construct your own with a text editor) to add symbols to the disassembly.

D816 cross-disassembler for 6502/65816 Cost $15.00

The TT utility will convert Ascii, and Atascii files from one format to another with several options.

TT text-translator Cost $10.00

H2B and B2H are used to transfer binary images in an ascii form, and convert them back to binary images. Many EPROM programmers use one of the supported hex formats.

B2H binary to intel/motorola hex and...
H2B intel/mot hex to binary translators Cost $10.00

A disk with all of the above (most recent versions of each) is available for $32.00 on 5.25" MSDOS diskettes. If you would prefer a 3.5" diskette, please indicate such, and enclose an extra $2.00

per diskette.

POLICY:

We accept personal checks, Money Orders, or cashier's checks made
out to DataQue Software. Personal checks must clear before
shipment is made. If you would prefer a COD delivery, include
$5.00 for special handling. Shipments are shipped via parcel post
unless special handling is noted. Foreign orders must be a money
order drawn on a US bank, in US funds, and require an additional
$5.00 added to the total amount. Any taxes are the responsibility
of the purchaser. All orders should include $4.00 to cover
shipping and handling, except for installations, which should
include return postage. All prices are in US dollars and are
subject to change without notice.

DataQue warrants its products for 1 year on parts (hardware and
media), and 90 days on labor. Shipping to DataQue Software is the
responsibility of the customer, and return postage is payed by
DataQue. Please include a complete description of the problem, and
a phone number in case we need to contact you.

Hi Phillip,
I have seen Nitelite's name on the ICN (Carina's own network).
If it is possible, it would be great if both some local CII and Pro SysOp's
could give you a hands on tour; who knows, ask around.
CII does support ANSI now, also SpartaDOS X. Really whatever one (Pro
or CII) comes out with first, the other adds it shortly after. CII networking
will have F-Net compatibility soon (it is in beta-testing). I have also heard
that CII/Pro network compatibility is being talked about.
CII 2.5 will be released probably this week or next week. I am not
sure what the latest version of Pro is, but I'm one of the local Pro SysOp's
can tell you.
Also MIO's can still be bought brand new from ICD, they have lowered
all the prices on thier Atari 8-Bit products. Take care, bye.....

Luis

I know that Atari ST's can be had for very little, but a used Apple //e,
mono monitor and 20-meg HD can probably be bought for under $500, if that.
ProLine and GBBS are both excellent BBS programs for the //e. In any case,
good luck with your BBS.

>community, to kind of help me decide which route to go.

There are several choices though for the Apple // series. Proline gets
lots of raves it seems. GBBS "Pro" is nice, and you're not restricted to
using AppleSoft BASIC. (It's nice to get away from line numbers once in
awhile.) Its language (ACOS) is similar to BASIC, but is more structured.

METAL though is a rather new Apple BBS language, has lots of the features
of the ACOS language, but adds a lot more. I'm still catching up with the
documentation that came with the disks, and that by no means is the entire
manual. The packaged program Future Visions is nice, comes ready for
networking, and is easily editable by any text editor from Freewriter to
ProTERM to AppleWorks, and even editable ONLINE (as is ACOS). Its only
problem right now is that it is so new that it lacks some drivers, namely
printer drivers and support for some modems, like my DataLink 2400
internal. It has a lot going for it though, including some of the
features others have mentioned that Proline has. (Sorry guys, didn't know
it would run on a non-GS.) I believe you can also use ANSI with it, and
several other emulations.

Modemlink won't download. You need 1030 Express, or some other 1030 term
prg. that downloads. Of course, (***big bummer***) you can't download it.
Try an atari user's group. I don't know if BRACE is still around, but they
might be able to steer you in the right direction. Also, Butler's electronics
might be able to help you. They're in Fed. Way. ph 941-9096 (I think).

3935. Atari manuals listed in B&C catalog

Newsgroup: comp.sys.atari.8bit
Date: 1991-04-20 07:50:38 UTC
From: jwd@en.ecn.purdue.edu
Message-ID: <1991Apr20.075038.3567@en.ecn.purdue.edu>
Source record: 114188

I was looking through my B&C ComputerVisions catalog and was wondering if anyone out there could make any comments/recommendations about the following?

*1) 1200XL SUPPL. TO TECH REF (I have the 400/800 tech ref notes set)
2) 810 DOS UTIL. SOURCE LISTINGS
3) 810 ROM SOURCE LISTINGS
4) DOS II REFERENCE MANUAL

* I don't have a 1200XL but do have 800XLs, a 130XE, & a 65XE. Obviously differences between the machines will cause some problems.

I am mostly interested in what topics are covered and general usefulness.

Please e-mail to me at jwd@ecn.purdue.edu. Indicate if you would object to my passing your feedback on to others. I will e-mail the results of my query to anyone who sends me his/her complete e-mail address. (This offer good until the end of the semester.)

You don't have to use the line numbers in BASIC when you edit your
Proline source. You can pickup MD-BASIC which gives you alot of the
power and comfort of a C compiler but it is actually a BASIC to
Applesoft translater. MD-Basic allows you to write your programs in
a text editor and then compile them into plain-jane Applesoft. You
can setup defines and includes in your source as well as call in libs
and such. It's the ONLY way to program for Applesoft. Also, you can
use a program like Program Writer which is basically a word-processor
for BASIC programs. Either way, it's simple, easy and powerful.

MD-Basic also comes with a decompiler so you can take plain BASIC
programs and decompile them into MD-Basic source with labels and
word-variables etc, etc.

Actually, there is no way to do such a thing with ModemLink. To
download stuff you will need another terminal program such as BobTerm.
I believe it is available for anonymous FTP on atari.archive.umich.edu,
but it may be a trick getting it onto your Atari. Your best bet would
be to find someone in your area (or perhaps a users group) that will
give you a copy on disk.

I have an Atari 8-bit computer for sale. The specs are:

Atari 800XL Computer
Indus GT Disk Drive (w/LED track display)
RF Connector
Parallel Printer Interface
Tons of software, including:
PaperClip
Gauntlet
Boulderdash
Boulderdash Construction Set
Karate Championship
Ballblazer
and much more...

I'll sell it all for $320 **OR** YOUR BEST OFFER. Please email inquiries to mmoore@ux.acs.umn.edu. You pay shipping.

Malcolm "The Capital MD" Moore

I designed my own 64K mod for the 600XL back in 1987. It requires
two 64Kx4 ram chips, and three jumper wires. Here it is.

HOW TO UPGRADE YOUR ATARI 600XL TO 64K RAM

THIS MOD IS COPYRIGHTED BY KEN SUMRALL. HOWEVER, YOU MAY FREELY
DISTRIBUTE IT, AND MODIFY IT, AS LONG AS THIS NOTICE IS INCLUDED
IN ITS ENTIRERTY. THE AUTHOR MAY BE REACHED AT THE FOLLOWING
EMAIL ADDRESSES:
ken%hpda@hplabs.hp.com
...!hplabs!hpda!ken

You will need the follow parts to perform this mod:
(2) 4464 RAM chip, 64Kx4, 150ns or faster.
Additionally, you will need chip pullers, a soldering iron, and 3 small
pieces of wire. I used wire wrap wire when I did this mod.

If the chips on your 600XL are socketed, you're in luck, otherwise, you need to
first unsolder the following chips:
(1) 74S32 location U18
(2) 74LS158 locations U5 and U6
(2) 4416 locations U11 and U12
and put sockets on the mother board in their place to make the job easier.

Now bend up pin 9 on the 74S32, and put it back in its socket on
the mother board. Bend up pin 3 on the 74LS158 in location U5, and put it
back in its socket. Also, bend up pin 10 on the 74LS158 in location U6,
and put that chip back into its socket. The last two chips you need to
change are the two RAM chips. Put the 4464 chips into the sockets at
locations U11 and U12 on the motherboard.

Now you need to install 3 wires to complete the mod. The first wire should
be connected between pin 3 of the 74LS158 at location U5, and pin 20
of the parallel bus on the 600XL. The second wire should be connected between
pin 10 of the 74LS158 at location U6, and pin 18 of the parallel bus.

The third wire connects between pin 9 of the 74S32 at location U18, and pin 45 on the parallel bus. That's all there is to it.

3941. RF interference

16KB, 6502 main processor, ANTIC graphics display processor. Max. resolution
320x192 with 2 from 128 colors. Several other but lower resolutions available.
Works with TV set only.

Computer is 1979 vintage, but still one of the best micros. The 1.77 MHz
clock rate is shared 2:1 by the processors. I hope you got the BASIC
cart as well or the machine will be useless.

As this was my first computer, I'll gladly supply more and even detailed
tech info if you mail me.

Hope this helps,

Techno

Thanks for the tips, but I've got one problem...how do i know which pin is which? That's the reason why I put off on doing it years ago, and then
I just let it sit for so long that I lost it.
So could you mail me, or post to the net on how to figure out what
pins are what? Thanks,
Sherm

Look at the IC so the notch on a narrow end is at the top. The pins are then numbered counter-clockwise from the notch. (Go down the left side, then up the right)

Matt

The best way is to use another program. Seriously!

I have one (that I haven't used in several years, but after about two
tries at using the modemlink software, I bought a shareware program from
APE (Atari Program Exchange, now defunct). If you can't get one, of some
kind, e-mail me and I can send you a disk. (Still, at 300 baud it is
Slooooooow.)

Bruce Hoover

The Atari 400 was a less expensive ($500?) version of the Atari
800.

The 400 has 16k of memory. Uses the same 1.7 MHz 6502 CPU.

There have been memory expansion kits for the 400. There are
reported sightings of even a 1Mb 400 out there. But the 48k is the
most common. There are also keyboard kits to replace the membrane
keyboard.

All Atari 8 bit hardware works.

WIth the exception of memory, the 400 and 800 a functionally the
same computer.

>
>Any ideas?
>

The various protection schemes used on the disk based Atari 800 series computers are fascinating, and some are very clever. Quite a number of them used custom disk formats, which an unmodifed 810/1050 would be unable to produce. The custom disk format allowed: bad sectors; sectors with CRC errors; unformatted tracks; tracks with extra sectors; sectors too long; sectors too short; and tracks with duplicate sectors (amongst other techniques).

Gosh I am remembering more and more of these techniques all the time. Some custom formats had 20+ sectors per track.

This is actually not too difficult, so long as you have low level access to the floppy disk controller IC, something which was impossible with the "intellegent" Atari drives. You can in effect program the floppy disk controller (FDC) to put any data format on any track that you wish, with the right computer system.

Now each sector on a particular track is preceded by a short header, which contains (if my memory is correct), the track number, and sector number, plus a couple of other things (?) and a CRC. The floppy disk controller may be able to check the track number against the track which it believes it is on (a flag will be set in the status register if this is not the case). If a certain sector number has been requested, then as soon as this sector number is seen in the sector header, the FDC will start to read the data portion. Now it is not too difficult to lay down a track in which *all* sectors are numbered 1 (for example) and each have different data. In this case the data read will be in effect random, and depends on the rotational position of the disk when the read request was issued. The FDC will read the first sector with a matching header.

On your disk, I suspect that there are two sectors with the same sector number, and the rest may well be normal. They will probably be arranged to be directly opposite each other on the disk (180 degrees apart). Now the trick is all

to do with timing. Send a read command to the 810/1050. One of the 2
sectors will be read, which one is random. With either no delay, or a
calculated delay do another read. The disk will have rotated by some
part of a revolution past the 1st duplicate sector, so that the next
read will catch the 2nd duplicate. The trick to recreate this yourself
is too code up two reads in assembler back to back, and check the result.
Run the assembly code using your debugger, rather than using the debugger
to read the sector twice. In the assembly code, there is a fixed delay
between both reads. If you are using a debugger, there is a random delay
between subsequent reads, hence the sector read is random.

This is very clever. Using the XOR means that it doesn't matter which
of the two sectors gets read first. If you copy the disk using a straight
forward sector copier when it come to the track in question, you will read
one of the two duplicate sectors, and it will be written onto the single
sector on the destination disk. As you say this new disk will read the
same twice, and the program would crash when executing the unmangled code.

Some years ago when I has an 8 bit Atari, I bought a booklet which
described these techniques, from an advertiser in Antic (or Analog),
and it came with a specially formatted disk to play with, using some
of their supplied programs. It really is a very interesting subject!
Simon, let me know if you are interested, I can send you further details.

A UK software house (Red Rat Software), used an interesting technique.
They burnt a hole in
the disk using a laser (apparently). The sector never read the same twice.
A copy would always read the same twice. A friend of mine (who had bought
an original incidently), experimented with adding a hole using a pin. I am
not sure of its success :-} .

The well known "Happy Mod" allowed the Atari computer, low level access to
the FDC, and so could read, analyse then format these custom formats.
I first saw a similar mod called "the chip" for an 810. Using the supplied
software, it was fascinating to see the 810 analyse the disk format and
display it on the screen. Duplicate sectors were very easy to spot.

I believe that one of the commands the 810 supported was to return the
status from the FDC after a read or write. The value passed back came
in part (or all?) from the FDC (an 1771 chip) status register. The register
knew about CRC errors, data overflow, etc , which is why some of the techniques
mentioned above were popular, as the 810 could detect these specially
created disk faults. A disk formatted/copied on the 810 would be fault free.
When the 1050 drive first came out, a number of software titles wouldn't
load, as the software believed itself to be copied, although they were
originals. This was because the 1050 used a different and newer FDC
(a Western Digital 2797 or similar), one which could support double density.
The 1050 status command returned similar information to the 810 including
a copy of the FDC status register. As the status registers of the 1771 and
2797 are different with different meanings to each bit, of course software
which relied on the 1771 status register bits been set according to these
disk faults, got confused, as the new FDC returned slightly different

status results.

On a different note, Atari used both the 2797 and 2793(?) FDC's which are virtually identical in the 1050. I bought a very early Happy mod (from B&C Computervisions? in Santa Clara), which didn't work in my 1050 drive, which I had brough over from the UK. This was due to the switch in FDC (97->93 or vica versa) used by Atari in the 1050. The original Happy ROM code, which replaced the Atari 1050 ROM, was written with a particular FDC in mind. I discovered this by disassembling the Happy ROM code. It was quite a lot of hassle to get them to fix it.

Ah, those were the days.....

Languages for the XL\XE

Iam sorry to take up 2 message slots but Ive got a few questions that I could really use some help on, and you guys seem to be the best

A plethora of questions in no particular order;

1. How good is ACTION!, what does it do and is anybody possibly willing to part with a copy.

2. Which is better, ACTION!, Light Speed C or Deep Blue C for speed of compiled programs and how do they compare with assembly. (as far as speed and learning curve);

3. Do any of the above languages have built in PM support?

4. Ive had trouble with one PD Action! program on the 1200 and I was wondering if Action!, LS C and DB C work well with the 1200. (yeah, I know I fee like a chump for owning a 1200 but at the time I wanted an XL bad, Real Bad)

Please respond via e-mail

Thank You very Much for your help, Im considering writing some game software for the 8 bit, possible shareware or freeware

Software for the XL\XE

Iam sorry to take up 2 message slots but Ive got a few questions that I could really use some help on, and you guys seem to be the best

A plethora of questions in no particular order;

1. Is it reasonable to assume that there is a viable 8-bit market for new games in the 10.00-15.00 range?

2. Are there any game companies still publishing for the XL/XE?

3. Is it worth while to sumbit games to Antic?

Please respond via e-mail

Thank You very Much for your help, Im considering writing some game software for the 8 bit, possible shareware or freeware. Ive written several games for the 8-bit in basic with light ML, but Id really like to do something awesome on the 8bit

Has anyone developed a way to use the Atari Proofreader (a spellcheck for Atariwriter) with Sparta Dos.

I am using Atariwriter (not atw +) and am wondering how or if it can be done.

The following items are for sale due to the death of a friend.

If you are interested in any of the following, please call Don Allis at
716-293-3415 after 5pm EDT, or send a message to me at:

BITNET: clf3678@ritvax
USENET: clf3678@isc.rit.edu
BBS: 716-436-3078 (I'm the SysOp)

Arrangements can be made for shipping, except where noted. All offers
will be considered!

o Atari 1040 ST system. Includes CPU, SC1224 color monitor. The drive in the
computer was replaced with an Epson drive after the stock Chinon failed (a
BIG plus in my book). Also included is a PC-DITTO II board that WORKS in
this machine! Problem is, there MAY be a chip problem with it. It's being
included because the 68000 socket is soldered on, and not worth the time
to remove. Also included is an external 5 1/4 drive. $550.

o Panasonic KXP 1090i printer, excellent condition. Rougly 192 CPS draft. Some
extra ribbons and paper. $200.

o Avatex 1200hc Modem. Perfect working condition. $50.

o Computer desk. Commercial grade, very heavy duty and well-built. Also
includes a printer stand. $300. *** WILL NOT SHIP THIS ITEM ***

o Atari 130 XE computer, includes power supply. $75.00.

o Atari 1050 disk drive. Includes power supply and data cable. $75.00.

o Atari 800 with tape drive and all cables. $25.

o IBM Public Domain Software Disks (5 1/4) $1.00 each. approximate 250
disk to choose from. All 250 for $100.

o 5 1/4 disks. Approximately 500 blank disks. Some single sided and
some double sided. 100 disks for $20. 500 disks for $90.

o Right Handed Golf Clubs. Allied Colonials. 3 Woods, 6 Irons, and 2
Putters. Bag, umbrella, balls, tees, everything you need to play. 1
year old. $150.

o Kenmore 18 cu. ft. upright freezer. White in color. About 9 years

I would suggest that you switch to At+ if you have it.
other than that try to do a KEY OFF command with sparta.
That sometimes helps. Atariwriter + is very friendly to spartados.
Its also a lot better than old atariwriter.. Theres a lot more features to
it. and aw+ is compatable with aw...

3959. What is an Atari 400??

3960. Modify an RS232 A/B switch to a cross switch for TxD and RxD signals

Newsgroup: comp.sys.atari.8bit
Date: 1991-04-26 22:06:11 UTC
From: wa2ise@cbnewsb.cb.att.com
Message-ID: <1991Apr26.220611.5755@cbfsb.att.com>
Source record: 114063
Cross-posted to: rec.radio.amateur.packet,rec.radio.amateur.misc,comp.sys.ibm.pc.hardware,comp.sys.atari.8bit

A/B switch to cross switch mod file

Lately, in my packet/phone modem/8bit home computer (with modem software that can store and load from disk) system, I added a VT100 terminal I got at a hamfest. This will let me view stuff using 80 characters across the screen, instead of always having to use the 40 characters the home computer does. Before I got the terminal, I used an A/B RS232 switch that switched all 25 wires. Now, to accomodate the terminal, I need a switch that can select connections of 8bit to TNC, 8bit to modem, terminal to TNC, and terminal to modem. A cross connect switch. Which would cost something like $25. I decided to see if I could modify the A/B switch. I use software Xon/Xoff flow control, which needs only 2 active lines and a ground. So, I need only switch 2 lines. Looking at the '89 ARRL Handbook, page 19-28, table 15), it shows the functions of all 25 RS232 wires. The ones I use are pin 2, TxD, and pin 3 RxD. Also pin 1, protective ground, and pin 7, signal ground. But there is a secondary TxD, called STxD, pin 14, and a secondary RxD, called SRxD, pin 16. So, I figured, I would connect the TNC to the common of the A/B switch, to the primary TxD and RxD. And connect the phone modem to the secondary TxD and RxD. (I would need to make a special Y shaped cable to do that.) And connect the 8bit machine to the primary TxD and RxD of the A connector of the switch, and the VT100 to the primary signals of B.

Here's the mod to make this work:
Wire a jumper from the A connector pin 2 (TxD) to B's pin 14 (STxD).
Another jumper from A pin 3 (RxD) to B pin 16 (SRxD).
And another from B pin 2 (TxD) to A pin 14 (STxD).
And a last jumper from B pin 3 (RxD) to A pin 16 (SRxD).
I also shorted all pin 7's together, and shorted all pin 1's together.
(This avoids switching spikes in the grounds that might glitch the equipment.

Now make the Y cable:
pins 2 and 3 of the "common" connector go to the TNC connector pins 2 and 3, respectively.
Pins 14 and 16 of the "common" connector go to the phone modem connector pins 2 and 3, respectively.
All pin 1's are connected, and all pin 7's are connected.

Label the modified A/B switch to describe what you did, so you don't try to use this switch to switch printers or something years later.

My switch was an Inmac, with all original wiring traces on a circuit board. All mods are added jumpers, and no cut traces. So, this switch could be restored later if I need to.

Source record: 114064

I was just messing around with SpartaDOS 3.2 and realized I could
change the commands -- make DIR into LS, ERASE into RM or ERA, etc.
The commands are stored in RAM, starting at locatin 3833 in my version.
They are in the format of one command after another. The last character
of each command is in inverse to indicate where one ends and the next
begins. You can either POKE new commands in, for temporary changes, or
use a sector editor, for permenent changes.

Paul,
This is truly the first of firsts. First off, the ATARI 400 is
6502 based processor, with 16K (probably) built in. It has a
"membrane" keyboard, which is someone's idea of a cruel joke. As far as the
floppys go, you do need specific drives for ATARIs. Some of the ones I
remember are Rana, Indus GTS, Percomm, ATARI's own 810 and 1050, and
I'm sure that there are others. If you have the 850, the serial
interface, you can hook up 3rd party drives, I think. Cartridges
available are numerous, I'm sure, but probably hard to find.

As far as what it's good for, well, I would probably use it for
learning 6502 assembler. It's not fast, it's not nice, but it'll do
the trick if that's what you're in to.

=> This is truly the first of firsts. First off, the ATARI 400 is
=>6502 based processor, with 16K (probably) built in. It has a
=>"membrane" keyboard, which is someone's idea of a cruel joke.

I believe the keyboard's purpose is to be "Peanut Butter & Jelly-proof".
It wouldn't be too bad for playing Star Raiders.

=> As far as the
=>floppys go, you do need specific drives for ATARIs. Some of the ones I
=>remember are Rana, Indus GTS, Percomm, ATARI's own 810 and 1050, and
=>I'm sure that there are others.

Like Atari's XF551 DSDD drive. However, there is little point in trying
to run a DOS in 16K RAM.

=> If you have the 850, the serial
=>interface, you can hook up 3rd party drives, I think.

You can do it, but not with the 850. The 850 has (I believe) 3 (4?)
serial ports and 1 parallel port. For third party drives, you probably
want something like the ATR8000, which will run IBM-type drives, a printer,
and possibly a serial device or two. In the upgraded version it will also
run CP/M.

=> Cartridges
=>available are numerous, I'm sure, but probably hard to find.

In the beginning, both the 400 and 800 shipped with 8K of RAM. Later on it was 16K, and a while after that the 800 could be had with 32K or 48K from the factory. For a time there were a lot of articles in the magazines on how to hack an 8K RAM board into 16K by changing the RAM chips, a decoder and adding a few jumpers.

Star Raiders runs in 8K of ROM and 8K of RAM. Impressive, isn't it?

Ummm... OSS had a number of languages, including an improved BASIC (BASIC A+) and Action! (a cross between BASIC, Pascal, and 6502 which compiled). Other languages available were FORTH (in both disk and cartridge), Pascal, C, Modula-2, a micro-COBOL, and I think a FORTRAN kicked around for a while..

DH> The Atari 400 has a big brother, the Atari 800. This machine
DH> has a full travel keyboard (in place of the 400's membrane type),
DH> and came with 32KB memory as opposed to the 400's 16KB (someone
DH> please correct me if I'm wrong).

You're wrong. :-)

Both the Atari 400 and the Atari 800 shipped with 16K of RAM.

You could easily expand the 800, though, because it had a number of (damn! I can't remember how many -- four total, I think) slots which the OS cartridge, memory cartidges (often 32K), and the occassional 80-column adapter could plug into. The 400 was more difficult, since it involved prying open the case, and using bare boards.

DH> Peripherals are attached to these two machines in daisy chained
DH> fashion, sort of like SCSI devices (is this correct?). One
DH> device was plugged into the processor, the next was plugged into
DH> the first device, and so on.

Well, they were daisy-chained, but I wouldn't call 'em SCSI.. :-) You could put up to four 810 drives on one computer (possible device IDs on the drive), along with hanging off an 850 I/O interface, which provided you with four serial ports and a Centronics parallel printer port. There was also the (in)famous Atari 410 tape recorder/player.

DH> These two machines had some really fantastic video game software
DH> available. I do believe that the modern Atari home video game
DH> machines have their heritage in the 400 and 800.

Well, sort of, in that the Atari 65XE game machine was initially released as an updated 64K version of the 800.. The 5200 used a (very) similar chipset (as indicated by the fact I had a couple of games someone dumped off a 5200 cartidge and ran on an 800). I can't remember what the 7800

had in it, although I would suspect it was similarly based.

They were good little machines, though -- right on the cutting edge
for a while....

Subject: Re: What is an Atari 400??

The Atari 400 is an 8 bit machine based upon the 6502
microprocessor. This is the same processor as the Commodore 64
and the Apple][series computers. It was the first (as I
remember it) personal computer with Sprite (or as Atari called
them, Player/Missile) graphics, enabling it to move a graphic
image(s) in front of or behind other images without them
disrupting each other. The hardware took care of everything, and
short of needing to learn how to program them, sprites did not
require the programmer to develop any special software.

O The Atari 400 has a BASIC interpreter available on pop-in
cartridge. Short of assembler, I'm not sure what other languages
are (or were) available.

The Atari 400 has a big brother, the Atari 800. This machine
has a full travel keyboard (in place of the 400's membrane type),
and came with 32KB memory as opposed to the 400's 16KB (someone
please correct me if I'm wrong).

Peripherals are attached to these two machines in daisy chained
fashion, sort of like SCSI devices (is this correct?). One
device was plugged into the processor, the next was plugged into
the first device, and so on.

These two machines had some really fantastic video game
software available.
I do believe that the modern Atari home video game machines have
their heritage in the 400 and 800.

As far as support goes for these machines, I'm not sure, but
aren't some of Atari's more recent 8 bit PC's compatible (or
almost?)

3970. XF551 Conversion

Newsgroup: comp.sys.atari.8bit
Date: 1991-05-01 20:06:41 UTC

Message-ID: <1991May1.200641.19040@magnus.acs.ohio-state.edu>
Source record: 114072

I just thought I'd tell everybody about an interesting upgrade for the XF 551 disk drive, from CSS (Computer Software Services). The XF 551 Conversion allows use of either a 5.25" or 3.5" mechanism. The dual drive upgrade allows use of both 5.25" and 3.5" drives. The DIP switches in the rear control the drive number of the first 5.25"; the 3.5" drive will assume the next higher drive number.

The other feature of this upgrade is the ability to read IBM and ST 360K and 720K disks, with the separate disk reader program. It cannot read IBM high density disks (1.2 or 1.44 meg).

It works great! Transferring files with it is a breeze -- you can get a directory of an ST or PC disk, and even convert EOL's automatically with the supplied program. It's nice to see somebody out there still cares about the 8-bit -- thanks Bob Puff! It even accesses files within subdirectories on IBM/ST disks.

I recently purchased a Blackbox from CSS, which allows you to easily interface SCSI/SASI hard drives to your 8-bit -- another great job by Bob Puff. It's nice to see somebody out there still doing something on our computers.

You can get more information from CSS, their BBS number is (716) 247-7157; the voice number is (716) 586-5545.

3971. ATARI HISTORY

Newsgroup: comp.sys.atari.8bit

From: AKH104 at PSUVM
To: achilles at unixland.uucp
Subject: Re: What is an Atari 400??

To set this all straight, since I am tired of seeing replies to this subject.
...First off the 400 is 16k upgradeable to 48k. Its borther the 800 is 32k up
to 48k. Note this is by using atari upgrades....upgrades to a Meg+ is possible
. The atari 850 has 4 RS232C ports and 1 standard printer parallel port. The
ATR8000 interface is an awesome piece of add on hardware...however finding one
is going to be tougher than life. The next generation of machines (8bit now we
are talking about) was the 1200XL. It is essentially an Physically redesigned
800 with a few Operating System changes and 64k standard (yes, I know not all
of which is addressable at once!..lay off it) Next, the true second generatio
n of atari machines were the 600XL and 800XL. These are not the same as the
1200XL! Note why: the 400/800 has either rev. A or the better B OS. ver.
The 1200XL has the 1200XL os. And the 600Xl and the 800Xl have the commonly
known XL OS's. The third generation of 8bits were the XE series of computers
which have the same OS as the XL's save the 1200XL (WHY it was called and XL
was because of its looks and atari's new line of components.) What makes the
XL/XE series of computers better than the 400/800/1200XL was the addition
of a parrallel bus which lets one connect massive memory upgrades and hardrives
.
Now for a brief review...
Computer Standard Ram O/S Year of Design notes...
400 16k A/B 1978/79? Membrane Keyboard...
800 32/48k A/B 1978/79? Full Featured computer.
1200XL 64k 1200 1982 Hackers dream/nightmare

600XL 16k XL 1983 Baby to the next one..
800XL 64k XL 1983 BEST ONE TO MODIFY!!

65XE 64k XL 84/85 NO PARALLEL BUS!!!!
130XE 128K XL 84/85 Newest powerful beast.

All these more or less compatible with one another....those programs that
won't run an any XL or XE machine can be runned with an Atari Translator disk
or the like....

Those 8bitters that were never released (really) are the following...
1400XL - Same as 800Xl + built in speach and modem.
1450XLD - Same as 1400XL + built in DS/DD drive. (Now you know where DOS4
came from!)
65XEP Same as 65XE but instead a portible with built in monitor.
65XEM Same as 65XE but advanced music capabilities for musicians.

The vaporware/hardware expansions are too long to list.

16bit machines know as the ST's...
520STxxxx xxx means several differnt releases/versions.
1040STxxx " "
Mega ST 1,2,4 Same as othes but with MEGS of mem.

xxxx - FM frequency modulation for TV set hookup!
e Enhanced for digital stereo sound and enhanced graphics...

32 bit machines....just released the Atari TT/30 (?) This is the BEST piece
of hardware available to any user of any system at this time (1991!)

Thats it any questions?

It's too bad that you had to take an essentially correct review of
Atari machine history and end it with an editorial opinion. Many
might disagree with this comment (including me).

By the way, you missed an important happening in Atari history that
occured between the 8-bit machines and the 16-bit machines. This
event was basically the flip-flop of the hardware and software
designers of the Commodore and Atari 8-bit machines. Check out your
history and you will see that, in general, the designers of the 8-bit
machine for one company, designed the 16-bit machines of the other
company (ie., the Amiga was designed by the Atari 8-bit people and the
ST was designed by the Commodore 8-bit people). Just for you
information/amusement. :-)

Scott

> to 48k.

No, the 800 was shipped with 16k and could be expanded to 48k (from Atari) and
more from 3rd party vendors.

> 32 bit machines....just released the Atari TT/30 (?) This is the BEST piece
> of hardware available to any user of any system at this time (1991!)

Oh, I am sorry, I try to stay out of any "my-computer-is-better-than-yours"
flame wars, but I can't let this go by. What was the criteria you used to
come up with this statement? I own a 32-bit machine (68030) and IMHO it
outperforms all the Atari ST/TT computers. Does this make my system better?
Does price have anything to do with it? If not, then my SPARCstation wins
hands down. Is it available software? Is it the quality of the software
releases? Is it how expandable the system is? Is it... you get the point.

Statements like the one made above hold no weight with explaining WHY one
system "is the BEST piece of hardware" since sliced bread.

Back to this group, the Atari 8-bit series was the best hardware platform
for it's time because of all the above reason I stated above, (IMHO). 8^)

> Thats it any questions?

No, but thanks for the look back on the 8-bit line.

> xxxx - FM frequency modulation for TV set hookup!

This is almost correct but a few things should be pointed out. The original 520ST had an RF modulator, but the disk drives were external. Later versions (and the 1040ST) had a built in floppy drive. To differentiate the 520's, the name was changed to 520STFM, where the F meant builtin floppy drive and the M meant RF Modulator. The 1040ST's had a built-in floppy, but not an RF modulator. I don't think they were called 1040STF's though, since they all came that way until the 1040STe's came out which do have an RF modulator. Some of this is from memory and what I have read. I have never had an ocassion to have one of each vintage sitting in front of me to confirm this. :-)

Source record: 114085

Hmmm. I can't believe that in this newsgroup, there are still wrong answers, or at the least, incorrect ones.

For the most part, the information is alright, but here is another clarification from someone who has been there from the start.

The Coleen and Candy machines (Atari code names for the 400/800) came out around 1979.

Here are some facts about the 400.

16k RAM. Not user expandible. Of course you found hacks making keyboards and expanding one to at least 1Mb.

10k ROM.

Almost all peripherals worked, except it's pretty hard to do any programming with DOS loaded in the computer. This was more of a computer if you couldn't afford an 800. And if anyone has 1982 copies of COMPUTE!, you'll see why Atari sold alot of 400s with the 410 Program recorder. 810 disk drives were around $450...

The 800:
Originally shipped with only 16k, the latest version came with a full boat 48k. Early versions had a slot door with a couple of catches to keep it shut. Since the last 800s came with 48k, they screwed them shut.

The slots:
Using 16k RAM boards (I even found these gems at Sears as late as 1987- still at $100 each!) you could plug an assortment of boards to get the full 48k or so, depending on your budget. For those with less cash, they had 8k boards.
The Operating System was on a single 10k board, I speculate that they might make upgrades, and they were to be swapped. Better than a disk based system, and better than a hard wired in system. Didn't pan out...
There were various third party products that plugged into a slot, one so that you had 80 columns among others.

The 400 had one cartridge (8k) slot, the 800 had two. Originally to accomodate two cart programs (which never materialized) the right slot was unused with one exception, Monkey Wrench that had among other things, a monitor. One that might have made a two cart (16k) program, Microsoft Basic II.

The 1200XL had improvements over the 400/800, but turned into an interim machine. Some improvements were great, but weren't carried into the 600/800XLs, and some were dogs.

The 600/800XLs were newer versions of the 400/800, but had a parallel expansion bus, and the 600XL (16k) could be easily expanded to 64k with the 1064 cartridge. These machines have AtariBASIC built in (the infamous Revision B- last ones had Rev. C) and remnants of the 1200XL OS.

The 65XE and 130XE were the Tramiel Atari versions of the 8 bit machines, the 65XE had Revision C AtariBASIC, but no Parallel Bus. The 130XE had 128k bank-switched, and had the parallel bus in a different configuration.

Maybe this bored you, maybe not. But this is how it was (is).

3983. DOS 3 and DOS 4

Newsgroup: comp.sys.atari.8bit
Date: 1991-05-03 07:20:38 UTC
From: mfolivo@sactoh0.sac.ca.us
Message-ID: <1991May3.072038.21653@sactoh0.sac.ca.us>
Source record: 114086

I want to correct one inaccuracy. The DOS that was designed for the 1450XLD was not DOS 4, but DOS 3.

I consider myself an expert, being about the last person in the Western Hemisphere that used DOS 3 instead of SpartaDOS. (reasons I'll not go into here...) Then I got an ST, but I digress.

The 1450XLD was a huge XL, with a double-sided (enhanced)double density drive built in, with an expansion bay for a second drive. It had a metal case, so you could put a monitor on top of it. If this is sounding like an Apple III, you're not too far off. Both were dogs, although a 1450XLD would command a far greater price than any Apple III, if you can even FIND an XLD. But I digress again.

DOS 3 was a wierd one alright, but in trying to remain compatible with all the single sided drives, DOS 3 and the XLD did things the absolute wierdest way.

Since the XLD had a double-sided (DS) drive, each side of the disk was treated like a separate drive. Yes, with DOS 3 and your XLD, your single, built in drive was actually D1: and D2:. The reverse side had it's own directory. So if you had two DS drives in your XLD, then you had D1: to D4:. Expanding on that, DOS 3 supported 8 drives like DOS 2 did.

I suppose you could have 8 drives, if Atari ever released a 1055 (?) DS drive. Or one could have an XLD with two drives, and daisychain 4 1050s...

The internal XLD drives were alot faster, as they were parallel, not serial like the 810/1050 drives.

Myself, I started with DOS 2, then DOS 3, tried DOS 2.5 then went back to DOS 3. I got DOS 4, but unless you have three drives, it was a pain. Actually, DOS 3 works better with three drives, D1: for the system disk, and 2 and 3 for files and copying.

Boy, haven't talked about these in a long time...

The 1400XL had the voice synthesis and built in modem of the better known XLD, but not the built in drives.

The 1600XL, if I remember correctly, would have been a CP/M machine.

Other vaporware/unreleased 8 bit stuff:

1090 Expansion Box. Lets you plug in various boards, such as CP/M. Last heard as a doorstop at Antic Magazine. (really!)

A Portable 65XE with built in 5" monitor.

Color and black and white thermal printers.

A music based XE.

If anyone needs the model numbers, I can dig them up.

I beg to differ. I owned an atari 400. I expanded it to 48k with a user expandable 48k ram board from a third party developer (AXLON).

|> I beg to differ. I owned an atari 400. I expanded it to 48k
|> with a user
|> expandable 48k ram board from a third party developer (AXLON).

And if my memory serves me correctly, that same exact board is
installed in my Atari 400 at home.

BTW, at one point Atari marketed their own 48K expansion kit for the
400. I saw this at B&C Computervisions in Santa Clara, CA a few
months ago.

Since this thread has been on Atari history (1400XL, etc.), what ever happened to the much heralded AtariTel venture? Many people were working on this, and the press was quite active about talking how this was 'going to change the way we use the telephone'. But I *never* saw any of the products. What were they? How were they different?

...

>Here are some facts about the 400.

>16k RAM. Not user expandible. Of course you found hacks making
>keyboards and expanding one to at least 1Mb.

Not entirely true... since we're questing for the way it was, there were
third party expansion boards for the 400 that made upgrading to 32K as
easy as unplugging the 16K board, and plugging in the 32K board.. I know,
I did it.. and it was easier than upgrading my ST..

There was a third party 48K board I later added which was about as easy
to do as the DataFree upgrade board I recently added to my ST.. you had
to solder a small template onto the bottom of the 400 motherboard to bring
an extra address line to the memory slot..

(I suppose that might qualify as a "hack" since it involved soldering..
the 32K board was a straight plug-in)

>Almost all peripherals worked, except it's pretty hard to do any
>programming with DOS loaded in the computer.

Actually, ALL the peripherals worked, since the 400 and 800 were identical..
with the 32K (or 48K) board installed, there was no problem doing useful
programming..

>And if anyone has 1982
>copies of COMPUTE!, you'll see why Atari sold alot of 400s with the
>410 Program recorder. 810 disk drives were around $450...

Ah... here's a bit of nostalgic trivia... my 810 disk drive cost $550..
about $50 *more* than my entire first 520ST *system*, including the 360K
disk drive (with 4 times as much storage)...

Eventually, with the 48K memory board, and an 800 keyboard I added in
a custom case, my first Atari 400 turned out to be an exceptionally
useful machine...

Kind of sad to think that I could trade it in today and buy a 1040STe for
less than the 16K 400 cost me originally...

I remember reading several months ago, on this very newsgroup, that the Atari archive at umich.edu had been "abused by someone in Germany" resulting in the server's being TAKEN AWAY FOREVER. However, SINCE that time, I have seen a flock of messages, also on this very newsgroup, REFERRING people to that self-same archive as a source of Atari 8-bit software and going unchallenged on that point.

MY question, then, is this: is the archive STILL UP, after all? Did the Powers That Be at umich.edu change their minds? I'd like to hear from some-one who knows!

So far, people have been saying that the Atari 800 first came out with 16K.
Actually, I think this is incorrect because when I first got the machine, it
had 16K, but it also came with a flyer. To wit:

NEW 16K MEMORY FEATURE
(Update to Atari 800 operator's manual)

"This version of the ATARI 800 personal computer system contains an additional
8K of RAM in the form of a single 16K Memory Module. This 16K memory feature
allows 16,384 bytes of user programmable memory, providing you with the
capacity to write and use longer and more sophisticated programs."

Basically, the rest of the sheet told about the contents of the new system
and that the 410 would no longer be shipped with the computer.

Later on, 16K became a bit too small, so we went for a WHOLE 48K! Fancy that!

The atari archive is still up. It was shut down for a short period of time
and security was enhanced to prevent future abuse.

It was stated that it was uncertain if the abuse was intentional or
accidental.

Some of the information which has been posted/misposted here in the last few days about how much memory came with the 400 and 800 when they were first marketed, caught my eye because I'd recently been leafing through exactly that section of my copy of the Atari OS User's Manual. Seeing all of this debate, then, makes it sure look like not too many folks out there HAVE the OS User's Manual. I know for sure I've never seen it included among any of the "systems for sale" that have ever crossed this feed. Is this because so few people HAVE it, or because those who do, like myself, would never dream of PARTING with it? Just curious...

3995. Atari Manuals

Newsgroup: comp.sys.atari.8bit

I have seen references to various Atari manuals from the 800 days, including:

The Operating System reference manual
The Operating System source code manual
Hardware Reference manual
DOS reference manual
DOS source code manual

and so on. Can anyone tell me which of these actually exist, and which are just different names for the same book. A brief summary of what they contain would also be helpful. More importantly, does anyone know if it is still possible to order them, and if so how. If not, would anyone be willing to provide a photocopy (I would be happy to pay duplication and shipping costs)?

Thanks,

Don't forget that if his Atari 400 is only 16k then it will not have
enough memory to drive a disk drive. Hopefully it has a memory upgrade.

Yes, the archive is still around...
(unix way to use it follows)
% ftp atari.archive.umich.edu
ftp> (user) anonymous
ftp> (password) anonymous
ftp> cd atari/8bit
ftp> binary
ftp> ls
ftp> get file.whatever
ftp> quit

then the file's right in yer directory. Now, go home, dial up the unix system,
and xmodem or kermit the file to your Atari.

Matt

P.S. I think mail access was restored as well.

3999. One Last Wish

Newsgroup: comp.sys.atari.8bit
Date: 1991-05-07 00:35:43 UTC
From: dddean@bluemoon.uucp
Message-ID: <9TwJ22w164w@bluemoon.uucp>
Source record: 114007

Hello:

I have been a user of the News Net for some time, and I know that whenever someone posts somethig totaly irrelevent to the sig that he/she gets flamed something fierce!

That is why I am donning my fire-proof suit to make this little post. It is one that I doubt anyone will flame me for, but I thought I'd be safe.

You see, there is a seven year old dying, and his one last wish was not that he get everything that everyone wants, but instead is a fairly reachable goal. I think that if you were to comletely read what I am going to show you; you too will agree.

The following is a text file that I found very touching, and thought that others could help out:

LAST WISH

A brain tumor is cutting short the life of seven-year-old Craig Shergold. His Last Wish doesn't seem very much to ask; simply that he receive some Get Well cards---hopefully enough to break The Guiness Book of World Records. If everyone reading this message could send him a card (or several!) and post this note on any bulletin boards or in any publications he/she may be in contact with, or even word of mouth, surely Craig's Last Wish will come true.

Send your card(s) to:

Craig Shergold

c/o Children's Wish Foundation

Suite 100

3200 Perimeter Center E.

Atlanta, Ga. 39346

P.S. If you are a person who believes in prayer, a prayer for this young man may, perhaps, find its way into another Book---and who knows?

He may just get a Get Well "wish" from someone else.

Please, if you can, send him at least ONE card. I know about the vastness of the net, and I think that we can all fulfill this young man's wish.

To do this, would be a kindness that eveyone can show!

Thank you for taking your time and reading this. Maybe some of us can relate to this. Maybe others can do more to help... who knows...

You can send any replies to:
David D. Dean, President David D. Dean, Vice Chairman
Explorer Post 891 Exploring Officer's Association
AT&T Systems/Bell Labs Central Ohio Council
dddean@bluemoon.uucp Columbus, OH 43227

Message-ID: <91127.191850AKH104@psuvm.psu.edu>
Source record: 114104

The first three manuals come part of the Atari Tech. Ref. Notes package.
That is the OS Ref Manual, OS source listing, and Hardware ref. Manual.
This package is available for B&C COmputer Visions in CA.
It is a $30 package? and is a must have for the ATari collector....
when ordering Pick up the 1200XL Ref notes Addition...for $12...this
you will need to see some of the changes from the 400/800 os to the
1200XL os to the somewhat similiar XL/XE os.
The Dos ref manual comes with whatever DOS you buy..2.0s, 2.0d?, 2.5....
The Dos Source manual is a COmplete source listing of Atari Dos 2.0s
by Compute! Books many, many eons ago...Howeve, if they don't have it
which is almost definite then try B&C...if you're very, very lucky!

4004. OS ROM versions in 800XL's

Newsgroup: comp.sys.atari.8bit
Date: 1991-05-08 14:50:42 UTC
From: phil@calvin.ee.cornell.edu
Message-ID: <1991May8.145042.21237@calvin.ee.cornell.edu>
Source record: 114008

I had to perform repairs on my aging 800XL last night, which involved
replacing the OS ROM with one from a very early production version 800XL
I obtained for spare parts value (lots of "Rev A"'s all over the inside
of the case and motherboard).

Anybody know if the OS ROM has different versions, just like the ill-fated
BASIC "A/B/C" ROM series? If so, are any of them buggy?

Oh, and if anyone wants to give me tips on desoldering IC's from an unsocketed
motherboard, feel free :-)

Source record: 114009

I am looking for a program I can run on a UNIX machine to convert ASCII to ATASCII. I would like something that I can simply execute before an x-modem download, and use with a pipe -- this way no extra files will be created. I want to put USENET newsgroups on my new 8-bit BBS. While there are many ASCII -> ATASCII converters for the 8-bit, it would be more convenient to do the conversion on the UNIX machine. If worse comes to worse I can probably change Trent Dudley's X/Y Modem download code to do the conversion (I think I have source laying around somewhere).

BTW ICD is dropping support of the 8-bit Atari completely at the end of June.

I have the new Z-Mag 192 and will send it up when I get a chance.

Sorry, this is not a flame, but last time I heard, this boy had recieved
TOO MANY cards. His IS now in the Guiness (sp?) Book, and the Childeren's
Wish people have asked that people stop sending cards because they don't
know what to do with them anymore.

They did however, thank everyone who had and would send cards.

It's the thought that counts!

Matt

P.S.: I'm sure that prayers are still being accepted.

here is a basic skeleton (in C) to do what you want to do. This task could
be pretty easily done in Atari BASIC on the Atari side, but it will definetly
go MUCH quicker on the UNIX end (unless the Unix machine is overworked or a
dog).

----------------------cut here-----------------------------------

#include <stdio.h>

/* compile command: cc ataconv.c -o ataconv */
/* this program will take a filename on the command line for input. */
/* because I was using it for another purpose, the output ALWAYS goes */
/* to standard output so you can do the following: */

/* ataconv ascii.file > atascii.file */
/* ataconv < ascii.file > atascii.file */
/* the first two have the same end result */

/* maybe you can do this (this is how our system works) */
/* ataconv ascii.file | xmodem -st */
/* pipe ataconv's output to the xmodem program (most efficient if that is */
/* your end goal. */

/* note: The shell of this program works--I used it for a TEX filter. you */
/* will need to define the defines below. The atari conversion part has */
/* not been debugged. (I think it's okay, though.) I am leaving, so if you*/
/* have any problems, I probably won't answer for at least 3 weeks. */

#define UNIX_LF \XXX /* linefeed where XXX is a 3-digit octal constant */
/* for ctrl-M. */
```

```
#define UNIX_CR \XXX /* unix CR */
#define ATARI_CR \XXX /* atari CR value */

main(argc, argv)
int argc;
char **argv;
{
FILE *fp;
int c;

if(argc < 2)
fp = stdin;
else{
fp = fopen(argv[1], "r");
if (fp == NULL){
fprintf(stderr, "bad file %s\n", argv[1]);
exit(1);
}
}

while((c = fgetc(fp)) != EOF){
if(isprint(c)) /* printables go out as-is */
putchar(c); /* you might want to filter the clearscreen which is */
else /* one of the curly braces. */
switch (c){
case UNIX_LF: /* strip linefeeds */
break; /* you may, depending on UNIX implementation */
/* want to strip CRs and convert LF */

case UNIX_CR: /* convert UNIX c/r to ATARI */
putchar(ATARI_CR);
break;
case

/* convert any other characters you want in a similar manner */

}

exit(0);
}

/* not a whole lot of error-checking here...be careful, don't toast your */
/* until you check your results */

/* disclaimer: I assume no responsiblity for the fitness of this code. */
/* IT'S ONLY A KLUDGE! :) */

/* Matt Woodward mwoodwar@yoda.eecs.wsu.edu */

Really, I find it hard to believe that there are many people who have
"been a user of the News Net for some time" to NOT have heard of Craig
Shergold. This first came up years ago. Craig got his wish, and
broke the Guiness record...3 times over. The local post-office are
throwing these cards out by the hundreds of thousands. He doesn't
want any more cards.

DON'T BOTHER SENDING CARDS. They will be thrown out.

rik.

This issue contains programming information and a review. The next edition will contain more 8-bit only information and be available next week, April 30, 1991.

DEFAULT DRIVER PLUS
===================
Reprinted from the Australian Atari Gazette
(edited by Ron Kovacs)
by Peter Bailey

The following short program makes several alterations to the AtariWriter Plus printer driver F (XMM801). Before making any adjustments you should know more about the AP.OBJ file.

Each data line contains the total information for each alteration and may be deleted if not required. The format for each line is (XL Version) sector, byte, (XE Version) sector, byte, number of bytes to change and data. In some cases the format is repeated until all the necessary alterations were made. NOTE: DO NOT ALTER THE DATA STATEMENTS.

Line 80 changes [SELECT] [.] from Double Strike (two passes) to Bold (one pass). NOTE: Bold is only available with Pica.

Line 90 changes [CONTROL] [G] 4 (superscript) and [CONTROL] [G] 5 (subscript) from condensed to current type face or selected type face, e.g. for elite subscript when using pica select elite first and then

condensed, [CONTROL] [G] 6 [CONTROL] [G] 5, then return to pica,
[CONTROL] [G] 1, when subscript is finished.

Line 100 allows selection of condensed after using elite. Previously
this was not possible as elite was not cancelled first. This is done by
having condensed first select pica (to cancel elite) and then sending
the required printer code.

```
EO 10 V=2:OPEN #1,12,0,"D:AP.OBJ":NOTE #1,S1,B1:S2=S1+194:B2=B1+20

FY 110 DATA -1
```

The screen color of AtariWriter Plus is 144. If you would prefer a less
contrast border, why not use 146 instead of 0. To make the change,
simply add the following line to the above listing. You may prefer to
preview the combination first, so with BASIC type 'POKE 710,144:POKE
712,146'.

THE WORKBENCH
=============
(Reprinted from the Mid-Florida Atari Computer Club Bulletin)
by Len Spencer

This is probably one of the last articles original to me for a while,
but I will try to bring you some of the best fixes, modifications, and
other projects of other authors in the coming months. In this article
however, I will try to give a little help on fixing one of the more
common breakdowns, the keyboard. I'm sure quite a few of you have an
Atari in the closet with a keyboard that has gone belly-up in one way or
another. You would like to put that machine to use again, or would like
to sell it for the best price as a working computer, so let's dig right
in.

The 400's membrane keyboard was a joke from the git-go. The only
solution there is replacement, and a lot of people replaced them with
third party keyboards. Since there were so many manufacturers, I can't
even begin to cover them all here.

With the 800's, as well as the 800XL, there were more than one design of
keyboards, by far the most durable of which was the full stroke,
contact-switch type. Stackpole was one of the major manufacturers here.
While I'm notsure about what percentage of 800's used this type, not
many of the 800XL's had them. If you should happen to have an 800 or
800XL with a Stackpole keyboard, then you should have very little if any

problems with it. If you lose function of a key here, a nice bath with a good tuner cleaner will take care of even the nastiest keys. If that doesn't work, then the keyswitch can be replaced.

The other was the printed circuit contact sheet, where conductive paint traces were silkscreened onto plastic sheets. My 800 is one of these, manufactured by Mitsumi, and a lot of the 800XL's were made by Chelco. Here you must exercise a little more caution. DO NOT use any solvent type cleaner or you will wash the traces right off. The only thing you can use here is a little water and a soft cloth. Even alcohol will discolor the traces and raise the resistance. If a trace is broken, a little dab of conductive paint, available at any electronic supply store, will fix it up nicely. If the key still doesn't work, try giving the spring that presses against that contact a little stretch. Be careful here, as it is easy to go too far and have the key stick on all the time. Remember, it is easier to stretch a spring than it is to shorten it, (cutting it is "NOT" an acceptable alternative!!). If the problem is a key sticking on all the time, try it with the pressure spring removed. If it stops repeating, then shorten the pressure spring by squeezing it down with gentle pressure. If it still sticks, then take the separator sheet (the one with all the holes in it), and add a piece of scotch tape over the corresponding hole, and cut out the tape where it covers the hole. Don't use masking tape or anything like that, as it is too thick. You should never use more than two layers of scotch tape for this type of repair. If it still sticks after two, then replace the keyboard or use the computer for parts. There are quite a few 800XL's floating around that can be had for a more-than-reasonable price, and you should be able to find one with a working keyboard.

The 130XE was a radical departure from the others, in it used only a single sheet of plastic, with a contact on the bottom of the keyshafts bridging two contacts on the sheet. Here if cleaning doesn't help, save yourself a lot of aggravation and replace the keyboard.

If you've found everything to be fine and dandy with the keyboard itself, but you don't have function of a group of keys, check the ribbon connector where the keyboard connects to the computer. There may be a bad connection. On the 800 this shouldn't happen, as this is a full plastic-bodied 18-pin connector. On the 800XL, the ribbon is merely an extension of the silk-screened sheet that slips into a connector on the main board. If part of the conductive paint has been scrapped away, you can reach fresh trace by trimming down the ribbon a little. If you find yourself having to go too far, then replace the keyboard.

Sometimes the problem is on the main board itself. The keyboard is read by two 4051 decoders and fed into the POKEY chip. Try swapping out the chips, one at a time, and eventually the keyboard should come back to life. If not, then there is a more serious problem that requires professional attention.

Hopefully, I have given you enough information here to enable you to do your own keyboard repairs and save a little money.

ADVENTURE SYNTAX MAGAZINE
==========

Adventure = SYNTAX = Magazine

Why should you try it?

* It's the only ST disk magazine dedicated to adventures and RPGs. The first issue was produced in July 1989. The magazine is bi-monthly and is available in colour or mono versions and all issues are STE-compatible.

* Each issue so far has contained several screenshots and an average of:
10 solutions (some with maps, some serialised)
11 reviews including some adventure-related book reviews
12 files of hints

* The specially designed SynTax 3-in-1 hints give two levels of hints - subtle or sledgehammer - depending how desperate you are!

* Each disk contains news, letters, and various information sections including a reference list of ST adventure/RPG software which is being continually updated.

* The SynTax PD library contains over 150 disks of adventure-related software including games, map disks solutions and demos. If you make a contribution to SynTax on disk, you can pick a PD disk to replace it - free!

* SynTax has had favourable reviews in all the major glossy magazines and the disks build up into a useful reference collection.

* At only 3 Pounds 50 Pence an issue or 20 Pounds for a year's subscription of six issues in the UK/Europe (Five Pounds 25 Pence /

THE ABC COMPILER
==========
by Mark Farmer, S*P*A*C*E

(Reprinted from the Puget Sound Atari News, May 1990)

If you 8-Bit Atari users would like to speed up your Basic programs so that they run like the high speed and memory efficienct compiled languages such as Forth, "C", Action, or Assembler then, do I have a Basic compiler for you! Monarch Data Systems has a Basic compiler called the ABC Compiler that will translate your Basic programs into compact pseudo-code, also known as p-code. Once compiled this p-code can be executed like any other binary program. ABC compiled programs run from four to twelve times faster than the original Basic program, depending on how well the source code is written. This makes it possible to use compiled Basic for professional game developement and other speed critical applications.

I first bought the ABC Compiler back in 1983. I own version 1.03, but know that it has been upgraded twice since I purchased it and now is at version 1.05. The ABC Compiler was the best back then and is the only Basic compiler out for the Atari 8-bit (the DataSoft and MGM compilers are no longer made). Even if these two compilers were still out the ABC Compiler is the easiest to use.

I am very happy with the ABC Compiler (a job hard to do, ask my wife). The ABC Compiler is cheaper now than it was when I originally purchased it ($50.00). The compiler comes with the program disk and a well put together manual that tells you how to use it. I highly recommend this Basic compiler. If you have any questions about the ABC compiler you can send a letter to me at:

THE 8-BIT DCB A Programming Tutorial
=============
by Dan Knauf of S*P*A*C*E

(Reprinted from the Puget Sound Atari News, March 1991)

Something that a lot of people seem to have a hard time learning to understand is the Device Control Block (DCB) in the Atari Computer. Actually, there are two of them - the one available to any programmer located in page 3 (memory location $300 or 768 in decimal) and the one located in zero-page that is used by the operating system and DOS. For now, we'll just worry about the one in page 3.

The main purpose of the DCB is to provide a uniform method of talking to any periphials attached to the computer. In the 8-bit Atari, this includes items attached to the SIO port and (for XL's and XE's) the expansion port. This includes such interesting devices as disk drives, cassette drives, hard drive interfaces, and the 850 interface to name a few. To keep this as simple as possible, we'll just talk about disk drives. This information pretty much applies to all periphials though.

The DCB is a table containing 12 bytes of information that is required by the operating system to talk to any and all these periphials. This info includes a device identifier (to specify D:, P:, etc.), a device unit number, a command byte, a status byte, a buffer address, a timeout byte, a buffer size, two auxilliary bytes, and one spare (unused) byte.

Here is a list of the addresses and the official Atari names of each of these fields:

* Hex Dec Name Purpose
----
*$300 768 DDEVIC Buss ID
*$301 769 DUNIT Unit number
*$302 770 DCOMND Command

*$303 771 DSTATS Status
*$304 772 DBUFLO Lo byte of buffer address
*$305 773 DBUFHI Hi byte of buffer address
*$306 774 DTIMLO Timeout value
*$307 775 DUNUSE Spare byte - unused
*$308 776 DBYTLO Lo byte of buffer size
*$309 777 DBYTHI Hi byte of buffer size
*$30A 778 DAUX1 Auxilliary byte #1
*$30B 779 DAUX2 Auxilliary byte #2

Once this table has been set up with the correct data, all that is necessary to talk to a periphial is a call to the operating systems Serial Input Output Vector (SIOV) located at address $E459 (58457 decimal). So if it's so easy, what goes in the table? Well, here is an expanded description of each item in the DCB and, where appropriate, legal values and their purpose.

DDEVIC is used to select a particular periphial. For now we'll just worry about talking to a disk drive. To do that DDEVIC must contain a $31 (49) which is the ID value for disk drives.

DUNIT is used to select the unit number. To talk to drive one, a value of 1 must be in DUNIT. For drive two, a 2 and so on.

DCOMND is the command to be executed. There are several valid commands, some of which are:

* Format $21 33
* Format enhanced $22 34 (1050 compatibles only)
* Get configuration $4E 78
* Set configuration $4F 79
* Put (no verify) $50 80
* Read $52 82
* Status $53 83
* Write (w/verify) $57 87

There are some other commands but these are the most useful and will allow you to do just about anything with a disk drive.

DSTATS is an interesting part of the table and the one I tended to forget about the most when I was learning how to use the DCB. First, it holds the status of the operation after a call to SIOV. If it is greater than 127 an error has occured and the number contained here is the Atari number for the error encountered. For example, a 138 here means the device addressed is not on-line (device time-out). Second, (the part I kept forgetting) it is used to indicate the direction of any data transfer to be peformed during the execution of the command. To send data do the drive, POKE $80 (128) here. To receive data from the drive POKE $40 (64). For commands not involving any data POKE a 0 in this location. Virtually all commands involve the transfer of some data so a zero isn't used here too often.

DBUFLO and DBUFHI contain the address of the data buffer. If you are sending data, it will be sent from this address. If you are receiving data it will received at this address. Example:

HI=INT(BUFADR/256):LO=BUFADR-256*HI:POKE DBUFLO,LO:POKE DBUFHI,HI.

DTIMLO is used to set the amount of time you want to system to wait on the periphial in seconds. I use a value of 7 a lot here. The default value is something over 30 seconds and I am an impatient sort. Usually if 7 seconds isn't long enough 30 isn't going to be either. The exception is the format command. I use a value of $F8 (248) because the format takes lotsa time.

DBYTLO and DBYTHI are used to indicate the number of bytes to transfer. This usually 128 (for single or enhanced density disks) or 256 (double density). Example:

HI=INT(SIZE/256):LO=SIZE-256*HI:POKE DBYTLO,LO:POKE DBYTHI,HI.

DAUX1 and DAUX2 contain the number of the sector to be read or written to. As with all the two byte fields this data is stored in 6502 format. Ie., the low byte is in DAUX1 and the high byte is in DAUX2. For example, to read sector 1 DAUX1 would contain a 1 and DAUX2 would be zero. Example:

HI=INT(SECTOR/256):LO=SECTOR-256*HI:POKE DAUX1,LO:POKE DAUX2,HI.

This concludes the description of the DCB. Now let's look at some of the commands and how they are used.

First comes the get configuration command. Before doing any reading or writing to the disk you must know what density it is in so you know whether to write 128 or 256 bytes to a sector. The exception to this is sectors 1-3. They are ALWAYS 128 bytes long. All drives I know of except the 810 contain a 12 byte configuration table that is user alterable. This table sets the density among other things. Here is a listing of the drive configuration table.

Byte # Purpose
* 1 Number of tracks
* 2 Step rate
* 3 Sectors per track - Hi byte
* 4 Sectors per track - Lo byte
* 5 number of heads -1
* 6 Density 0=single 4=Double or Enhanced
* 7 Bytes per sector Hi byte
* 8 Bytes per sector Lo byte
* 9 Drive present flag
* 10 Not used (Stock XF551 returns a $41 here)
* 11 Not used
* 12 Not used

Notice that the two-byte values are NOT in 6502 format. The high byte of these values comes first! Another thing to be aware of is that hard

drives use some of these locations a little differently. The number of heads is invalid for hard drives. And the first two bytes of the table contain the total number of sectors in the partition instead of tracks and step rate. I know this to be true of the BlackBox interface and think it holds true for the MIO also.

To read the table from the drive, you must set up the DCB to receive 12 bytes of data at an address you specify. Then poke $4E (78) into DCOMND and call SIOV. Here is a one line call to SIOV from BASIC.

```
X=USR(ADR("hLYd")):REM the 'd' is inverse.
```

Once you have read the configuration look at byte 7. It should be either a 1 or a 0. If it is 0 the disk is single or enhanced density.

Otherwise, it is double density (256 byte sectors).

This method is not perfect. If you have a Percom drive you should read sector 1 (remember it is always 128 bytes) before getting the configuration to ensure accuracy. Reading sector one does not screw up other drives so it is safe to do under any conditions. Enhanced density disks can confuse the US Doubler and XF551 drives. I personally HATE enhanced density... One of my favorite snivels is "Why couldn't Atari have just used real double density???" (Imagine a loud voice with a strong nasal whine here.)

Now that you know how to GET the configuration, you know how to SET it too. You set the DCB up with the same values except for the command which is $4f (79) and DSTATS which is $80 (128). The only values you can set are: Sectors per track (18 for single or double, 26 for enhanced), number of heads (0 or 1), density (0 or 4), and bytes per sector (128 or 256). Note that enhanced density requires a 4 in the density byte and 128 byte sectors as well as 26 sectors per track. The most useful place to use the set configuration command is immediately before issuing a format command. This ensures that the drive will for sure be formatted in the density you want. Some DOSes don't even do this. (Ever try to format a disk with DOS 2.0 that has previously been formatted in double density? Ugh!)

The next command to mention is the STATUS command ($53 or 83 decimal). This can also be used to get the density of the drive. Again, the US Doubler can get confused and lie if enhanced density disks are used. (I HATE enhanced .....) To use this command you must set the DCB up to receive 4 bytes from the drive. The bytes received are described as follows:

```
Byte Description
------------------
1 Command status
2 Controller chip status
3 Timeout value for formatting
4 Unused (current track # for Indus drives)
```

If the first byte of the data returned is greater than 127 then the drive is in enhanced mode (supposedly). Otherwise, if bit 5 is set the drive is in double density. Else the drive is in single density. If bit 3 is set the disk is write protected. Bits 0-2 are error bits. If any are set then some error has occured.

Reading and writing sectors is the next thing on the agenda. To read a sector set the DCB up to receive data. Poke the low byte of the sector

number into DAUX1 and the high byte into DAUX2. Then call SIOV and your sector will be read into memory - assuming the drive door is closed and there is a readable disk in there and everything. To write a sector do the same thing but set up DCOMND and DSTATS to send data instead of receive it.

Finally, let's look at the format command. You must set the DCB up to receive data when you format a disk. The drive will return a bad sector list when the format is completed if successful. So poke a 64 into DSTATS and the address you want the bad sector list returned to in DBUFLO/HI. Also, poke a 0 in DBYTLO and a 1 in DBYTHI since the list can be 256 bytes long. Immediately after the format command, check for an error as described below. Then check the first two bytes of the bad sector list buffer. They should both be 255. If they aren't then there are bad sectors on the disk.

Errors! Well, they are bound to happen sometime. Immediately after your call to SIOV you should PEEK(DSTATS) and make sure the value there is not less than zero. If it IS greater than 127 then an error has occured. If this happens, the value in DSTATS is the same value that would normally show up in location 195 if BASIC had generated an error. BASIC will NOT see or TRAP any errors that happen when you talk to the disk drive through the SIOV. So, make sure you check for them yourself.

Don't get discouraged if your first attempt at doing direct sector I/O isn't successful. It took me some time to get comfortable with this method of communicating with periphials and I made some dandy mistakes too. I have even managed to format a partition or two on my hard drive. It'd probably be a pretty good idea to make sure you have a scratch disk in the drive when you do your experimenting....

Anyone interested in the IOCB's? There's 8 of those! Aw... maybe next month...

A TRIO FOR TURBO BASIC
======================
by John Picken, GCACE

Here are three short and easy programs. The first is a "fix", the second is a MyDOS 4.5 "mod" and the third is a new utility. Note that all three programs will only run under Turbo BASIC which is readily available to any user group member. There are two reasons for this: first to demonstrate some of Turbo's fine features and, more importantly, programming in Turbo is about ten times easier than in Atari BASIC (laziness wins again).

My original version of MYDOS RAMDISK AUTOLOADER, that was published in the July PSAN, fits the expression "too smart by half". It works fine with 256K because, on the 256XL, an unformatted RAMdisk shows "65535 FREE SECTORS" which tells the loader formatting is needed. The rub is that an unformatted RAMdisk with the 320XE shows "255 FREE SECTORS". Since this could mean a nearly full, formatted RAMdisk, the loader

doesn't format. Program A fixes the existing autorun file for the 320XE; it replaces the "smart" code with "smarter" NOP's so the loader formats any time DUP.SYS is not found in the RAMdisk. Apologies to any 320XE owners who have been "blue-ifying" the air.

Program B makes a modification to MyDOS 4.5 DUP.SYS which results in different default colours and keyboard parameters. I find a white on black display to be more readable on a monochrome monitor but you are free to select any colors you like. The values for the keyboard produce a fast, quiet cursor; to change them, refer to page 208 in MAPPING THE ATARI. If you do something that results in a GRAPHICS 0, (Copy to/from S: or E:, load Turbo BASIC, etc.) the colors revert to normal but the keyboard parameters remain as set until you hit RESET. The modification uses two loops which is why COLOR3 and HELPFG are included - just leave them at 70 and 0. All internal changes are made so that your modified DUP will be written if you "Write DOS Files" from DUP.

Program C produces a short machine language file that switches BASIC off or on. It is a toggle - if BASIC is on, it will be turned off; if off, it will be turned on. You can load the program anytime and/or, include it in an autorun file (it should be first with others appended to it). As an autorun, it has the effect of reversing the OPTION key so that you would need to press OPTION to enable BASIC at boot.

XEP80 STATUS LINE

by Michael D. Bjorkman, S*P*A*C*E

The XEP80 has a number of special features, not all of which were demonstrated in the DEMO80.BAS program which comes on the handler disk. One of these features is a one line text window below the 24th and last line of the normal 80 column screen display. This extra text line is called the Status Line and is handy for printing error messages, prompting for input, etc. for those cases where you don't want to mess up the regular 24 lines of text.

The Status Line is not accessible from BASIC using the PRINT command. Therefore I've written a short ML routine which can be called with a USR command. My program will only print messages to the status line and will not accept input from the status line. That is left as an exercise for the reader.

Listing 1 is a short demo I've written which uses my Status Line ML routine. The program first initializes the ML string, then lists half of the program to the screen, then prints a message to the status line, then lists some more of the program, and then erases the status line.

Listing 2 is the UNICHECK checksum file for checking your typing. Do not type Listing 2, it is not part of the program.

Listing 3 is the source code for the ML string. It was written to be relocateable so that it could be placed in a BASIC string.

If you want to use the ML string in your own programs, then you will need lines 110, 120, 210, 220, and 1000-1080. The length of the message which can be printed to the status line should only be limited to the

4013. Action! tutorial

width of screen memory, which is 256 characters. I don't know what
happens if more than 80 characters are printed to the screen, however,
they should all be there. I haven't tried this, but you should be able
to horizontally scroll over to read the rest of the message by using the
proper CIO call. I also don't know what happens if you try to print
more than 256 characters to the status line. Another exercise for the
reader. Also, I haven't built an automatic clearing of the status line
into the ML routine. You are responsible for clearing the status line
of your messages. That can be done by printing a string of spaces to
the status line. See line 170 in Listing 1.

4015. Looking for games?

Newsgroup: comp.sys.atari.8bit
Date: 1991-05-12 00:48:38 UTC
From: RAD2@NS.CC.LEHIGH.EDU
Message-ID: <11059119
Source record: 114019

I am looking for some information on the following games: The Return of Heracles, Excalibur and M.U.L.E. I realize that these games came out a long time ago, however I am hoping that someone out there may be able to tell me if its still possible to get them and/or if they know who made them, any help would be greatly appreciated.

4018. SIO-RS232

Newsgroup: comp.sys.atari.8bit
Date: 1991-05-12 16:11:43 UTC
From: cccph@jessica.cs.ucla.edu
Message-ID: <2738@lee.SEAS.UCLA.EDU>
Source record: 114023

Some time ago, I saw an ad for a cable that allowed one to connect an RS232 device to the Atari SIO port.

Are these cables still available, or can they be made (by the home user) easily?

Thanks in advance.

4019. 5200 carts on the 400/800/1200....

Newsgroup: comp.sys.atari.8bit
Date: 1991-05-12 16:14:44 UTC
From: cccph@jessica.cs.ucla.edu
Message-ID: <2739@lee.SEAS.UCLA.EDU>
Source record: 114024

Someone mentioned a process for translating Atari 5200 software into
a form which could be run by the Atari 400, 800, etc. computers

Does anyone here know the details of this process?

(By the way, I'm looking for a Tempest 5200 game cartridge, as that
game was never released for any other Atari game/computer, to my
knowledge.)

Thanks in advance.

>Would anyone happen to have a manual for an old Axiom AT-846 parallel
>interface? Specifically, I need the pinouts of the centronics parallel
>port...I have a printer here that I can't get to work any need to know
>the pinouts for a cable..Is Axiom still in buisnesS???
>
Sorry, I don't know about Axiom corp. I did have an PR: connection though (Yes, my familly bought its first Atari 800 in 1981, and I bought a 130xe in 1985 or 86. Now, I'm a happy Mac II user, but the Atari can never be beat for having fun with the harware). Anyways, the partial pinouts of the centronics parallel interface for a 36 pin centronics male plug along with the PR: 15 pin cable is (The PR used a DB15P plug):

```
Centronics PR: Name
----------------------------
1 1 Data Strobe
2 2 D0
3 3 D1
4 4 D2
5 5 D3
6 6 D4
7 7 D5
8 8 D6
9 15 D7
11 13 Busy
16 11 Ground
32 12 Fault
```

I sorry I don't have information if the Axiom is a different connector.

```

>Some time ago, I saw an ad for a cable that allowed one to connect
>an RS232 device to the Atari SIO port.
>Are these cables still available, or can they be made (by the home
>user) easily?

If you are really into hardware hacking, you could make one.

Several RS232 interfaces have been released commercially over the years.
The most common are the 850 interface, which has 4 RS232 ports and
a printer port, and the P:R: Connection, which has two RS232 ports and
a printer port. The ATR8000, BlackBox, and MIO all have an RS232 port and
printer port. I saw an ad for an ATR8000 for $50 on my BBS. The ATR8000
also allows you to easily interface 360K IBM style disk drives to your
Atari 8-bit. Oh, yes, it also runs CPM programs (the Atari acts as
a terminal to the ATR8000).

About seven months ago I saw a message on Compuserve from John Demar.
He is selling what are called 'R-Links' (apparently extra inventory from
1985). They come in several configurations. The base cost is $12.50 for
an "R-Link NC" -- NC meaning no connector (you solder the modem cable
connector to the wires coming out of the PCB). It does not have a case.
It is very small and can be mounted inside your modem. You can also solder
on a printer connector on and use it as a printer interface (a special
handler is included for both R: and P: devices). It works just fine and
the price is right. The guy's address is:

John Demar
(315) 451-6470
4753 Freestone Road
Liverpool, NY 13090

BTW I think he sells them with a box and/or cable soldered on for a little
extra (around $20). I would call and check pricing/availability before
ordering.

4022. Answers to various questions

Newsgroup: comp.sys.atari.8bit

Someone said (a while back):
>...any information about official 8bit hardware manuals...

I have before me the following:
Atari Technical Reference Notes (includes OS User's Manual, OS Source Listing, and Hardware Manual)
Atari DOS Reference Manual
Atari DOS II Reference Manual
Atari 850 Reference Manual
Atari 800 Operators Manual
SAMS Programmer's Reference Guide for Atari 400/800 Computers
The Technical Reference Notes were definately worth the $20 I paid for them; pick up a copy if you can find them anywhere (unlikely). They were published in 1982.

Raymond Alexander Dixon says:
>I am looking for some information on the following games: The Return of
>Heracles, Excalibur and M.U.L.E. I realize that these games came out a
>long time ago, however I am hoping that someone out there may be able
>to tell me if its still possible to get them and/or if they know who
>made them, any help would be greatly appreciated.

I can only help with MULE. It was produced/marketed by Electronic Arts corporation. Although EA is still around and producing software for a number of platforms, they no longer produce MULE. If you have questions about the game, I'd be happy to answer them; if you want to buy a copy, try advertising here and in misc.wanted.

Charles Hobbs says:
>Someone mentioned a process for translating Atari 5200 software into
>a form which could be run by the Atari 400, 800, etc. computers
>Does anyone here know the details of this process?

I'm not familiar with that process; there is, however, software available to "crack" 400/800 cartridges and save them as binary files to disk, where they may be run without the cartridge.

>(By the way, I'm looking for a Tempest 5200 game cartridge, as that
>game was never released for any other Atari game/computer, to my
>knowledge.)

There was an official 400/800 cartridge version of Tempest released by Atari; where you could find it now is anyone's guess.

4023. Re: Conversions: ASCII -> ATASCII

Newsgroup: comp.sys.atari.8bit
Date: 1991-05-14 11:43:36 UTC
From: Chris_F_Chiesa@cup.portal.com
Message-ID: <42312@cup.portal.com>
Source record: 114028

Frank Seipel asks about ASCII <--> ATASCII conversion on a UNIX system.

Frank, the "standard" (IS there any such thing? :-)) UNIX package contains a utility called "tr" which can be convinced to do what you want. "tr" takes a UNIX character stream (a file, pipe, etc.) and substitutes characters FROM a set you specify, with OTHER characters from ANOTHER set you specify. Most people use it for, say, ROT13 transforms, up- or down-casing, etc., but you can ALSO use it for ASCII/ATASCII conversion!

The ASCII to ATASCII conversion consists of replacing all UNIX "newline" characters with ATASCII "eol" characters, and the reverse conversion is -- of course -- the opposite.

Without further ado, the commands to do the deeds:

ASCII to ATASCII:

```
tr <inputfile >outputfile '\012' '\233'
```

ATASCII to ASCII:

```
tr <inputfile >outputfile '\233' '\012'~r
```

I was as thrilled to discover this a few years ago, as I'm sure a few people are to hear it today! Enjoy! :-)

From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <42363@cup.portal.com>
Source record: 114030

I don't know anything about the "Update" disk, but Atari Interface magazine has recently begun shipping an 8-bit "Disk of the Month" to supplement their already popular ST Disk of the month program.

I'm not sure how much the disk subscription would be, but their phone number is: (313) 973-8825.

If you belong to one of their participating Atari user groups, the club should be able to obtain the Disks of the month for a greatly reduced price... check with your club librarian.

I'll see if I can get a listing of what's been on the most recent disks..

Newsgroup: comp.sys.atari.8bit
Date: 1991-05-16 18:43:27 UTC
From: Chris_F_Chiesa@cup.portal.com
Message-ID: <42394@cup.portal.com>
Source record: 114031

Good grief. I just noticed a typo in a very bad place in my recent posting
about using UNIX 'tr' to translate between ASCII and ATASCII text file formats.

The command for translating ATASCII to ASCII came out as

tr <inputfile >outputfile '\233' '\012'~r

... but the "~r" on the end is LINE NOISE!

The command should end with the closing quote after the number 012.

My apologies for letting this get through in the first place! I'm horri-
fied...

Greetings.

I would like to get an apple 2 emulator for my pc. I don't care if it's software or hardware. I have taken a look at the one on simtel and about gagged. It's a nice program if all you're going to do is run applesoft basic stuff.

So here's the criteria.
1: has 128K free to the "apple"
2: is apple][e or bettor.
3: displays color.
3: will go into 80 column mode (pr#3).
4: will READ and WRITE apple dos 3.3 (16 sector) files with an ibm drive.
5: will run copy protected stuff (my collection of Ultimas)

the list looks about right off the top of my head. Any info is greatly appreciated, wanted and/or needed (I want to get rid of the old][e and recover some desk space).

msmith@att3b2.tricity.wsu.edu

You might as well give up on 4 and 5. Apple][and IBM drives use
different modulations on the disk. The hardware is incompatible.

What is this doing in comp.sys.atari.st anyway? What is this doing
in any of the groups listed above? Maybe its time to learn to use
netnews responsibly.

Message-id: <91May038:23_pm@Blade.citadel>
Subject: [none]

Minor point about the naming of the ST line -- the original 520ST
and 1040ST had no additional letters, but the 1040ST had an
internal floppy drive. Later, Atari added an internal floppy
drive to the 520, and renamed the computers the 520STfm (for
_f_loppy and RF _m_odulator) and 1040STf (for _f_loppy). For a
while, Atari produced 520STf's with no RF modulator. The Mega
1/2/4ST have separate keyboards, an internal expansion bus, and a
blitter chip (which Atari insists is a BLiTTER. Go figure).
Then Atari introduced a slightly improved video chipset (larger
pallatte) and much better sound chips, and introduced the 520STe
and 1040STe (for _e_nhanced). Recently Atari has introduced the
Mega 1/2/4STe, a 16 MHz 68000-based version of the STe, with an
internal floppy drive, (optionally) an internal hard drive,
separate keyboard, and a VME bus slot, for which all sorts of
nifty cards are available. They also introduced the TT, a 32 MHz
68030-based computer with the same specs as the Mega STe. Both
incorporate a new version of TOS, the first major revision that
Atari has released, and (correct me if I'm wrong) add a number of
new display modes ranging up to about 1200x1000 monochrome and
including a 256-color display mode (out of a pallatte of 16M).
One unique aspect of the TT is that it has two RAM busses, one
for 16-bit ST RAM, and one for 32-bit TT RAM. Benchmarks of the
TT have it performing remarkable similarly to a Mac IIfx, which
is pretty good for a much cheaper computer with a slower clock
speed.

For the guy that was trying to get the AWP spellchecker to work,
IT WON'T! You need a special program (built into the AWP program
to read it. Try Antic's Spell Magic. This WILL work for what you
want to do.

What was the Atari 400:
I think it was all pretty much said except that Even with all
the new high speed stuff out there, The ol' Atari 8-bit machines
are still pretty amazing. I've had 8-bit Atari computers since
'82 and I'm still finding new applications for it. As for
languages, there are Atari BASIC, MS-BASIC, BASIC A+ Turbo BASIC
XL, BASIC XL, BASIC XE, Lisp, Forth, Atari Assembler, MAC/65,
Action!, Pilot, and many others that I can't remember off hand.
BTW, Dataque should be nearing release of their new C: compiler.
There are about 4 or 5 C: compilers and a few Pascal cimiplers
out there too. Lots to choose from.

Subject: [What is the Atari 400]

Today we have many standards: the PC ROM BIOS, The AT bus (called ISA), RS232 serial prts, Centronics parallel ports, the EISA bus, the MCA bus, the modes of the 8080, the 80286, the 80386, etc., etc.. What we forget is that When Nolan Bushnell was inventing the Atari computer these standards weren't nearly the standards they are today ... they were in the future. Atari was in the midsty of CPM, Osbornem Kaypro, and a newcomer called the IBM PC. He invented a few wheels of his own - the SIO (serial input/output) is remarkably like SCSI - just slower. but it served (and serves) the needs of the Atari quite well. It ties together a lot of peripherals - disk drives, modems, printers, plotters, and the Atari 850 which ties in all the other RS232 and Centronucs peripherals. Today, Nick Kennedy is producing a product called the SIO-2-PC which allows the Atari 8-bit to use a PC as a huge ramdisk - even booting from it. it also allows the Atari to print on the PC's printer. (do you remember the Rocky and Bullwinkle show -Mr. Peabody, the dog who had a pet boy, Sherman? The SIO-2-PC allows your 8-bit Atari to have its own pet PC!)

Membrane keyboards are peanut-butter and jelly-proof, but they're Hell to type on. Why do you think I gave away my Sinclair/Timex? I'm out of gas -more next time

Subject: Tetris

I have two different versions of Tetrix, a tetris clone. One drops the blocks as soon as you pull back on the joystick, the other one drops it more slowly and gives you one last chance to turn or move it. I'll have to hunt them up, but when I find them I'll upload them to GAMES.

I remember reading about people using the 400 in factories
and darkrooms, where spills of unusual liquids would kill a
normal keyboard. That didn't stop me from replacing mine with a
Stackpole keyboard, though.

The Atari 8-bit computers were the forerunner of the Amiga.
Not a bad heritage, when you stop to think about it.

The fact that the Atari 8 bitters were the forerunners of the
Amiga had recently come to my attention. As a result, I've been
messing with the 800 that I acquired quite some time ago but
never used much.
I found the posts about the various variations of the
400/600/800/1200 to be very interesting. If someone would post
the same kind of info about the various versions of DOS
available for the 8 bitters, I'd appreciate it.

Most of the Atari DOS's will be listed here:

Atari DOS 1.0 ---Similar to 2.0 but not as fancy. Disappeared early.
2.0 ---Still a strong standard in the Atari world. Can't
seem to shake this one.
3.0 ---Died a nasty death. If you have it, get rid of it!
2.5 ---Enhanced version of 2.0 with many added features
and extended storage capabilities with the 1050 and
XF551 drives.
XE ---DSDD dis for the XF551 drives. supports up to 360k.
MyDOS 5.x ---A very enhxnced version and offshoot of AtariDOS
2.0. Somewhat mass compatible with other DOS's.
SpartaDOS disc---MS-DOS type DOS. Probably the MOST all around
compatible of all Atari 8-bit DOS's except for SDX
CART---This has to be the best Atari 8-bit DOS available.
TopDOS ---Don't know much about this one except that it is
still available and supports up to 360k disc. There
are others, but they are not very popular or wide
spread.

BTW MyDOS, AtariDOS XE and SpartaDOS all support multi-level
directories. Unfortunately they don't all do it the same way.

Comment on message posted by "Robert S. Ely@Atlantis_NJ" on 91May11:

DOS 1.0 -- A very early DOS distributed by ATARI.

DOS 2.0 -- This is the UNIVERSAL, generic ATARI DOS. If you are distributing programs through uploading or downloading, make sure they use the DOS 2.0 or DOS 2.5 binary load address. --EVERYONE-- owns a copy of DOS 2.0 no matter what drive or equipment they have.

DOS 3.0 -- A troubled, nasty ATARI DOS, quickly abandoned by all of the userbase.

DOS 2.5 -- The new GENERIC, UNIVERSAL ATARI DOS. DOS 2.5 is essentially DOS 2.0 with a fix to run ATARI --ENHANCED DENSITY-- for the 1050. ATARI DOS 2.5 was the first DOS released by ATARI to come with utilities programs to UNDELETE deleted files, check floppy disk directory integrity, and configure drives. Basically DOS 2.5 was still a single sided, single density DOS, with the addition of ATARI special --ENHANCED-- density to stretch out the single sector file density to expand your floppies from 707 sectors to around 1200 sectors on a floppy. (Sometimes ATARI ENHANCED DENSITY was affectionately referred to as "single density and a half". There had been patches for "enhanced" density floating around before ATARI officially incorporated it into their DOS.) DOS 2.5 works very well. Any files that are past the 707 sector limit show up in angle brackets. "<tictacto.bin>". These files are unreadable on the "very old" ATARI drives, which is why programmers use DOS 2.0 to create working software under, and is why DOS 2.0 has the widest circulation, i.e. they know beforehand that it will work on --EVERYTHING--.

DOS XE -- DOS XE is the latest, and probably the last, officially released ATARI DOS. It is a double sided, double density DOS, that was finally pushed late out the door, for use with the new ATARI XF551 disk drive. Unfortunately, as the name implies, for DOS XE to work correctly, it really needs to be run on an ATARI 130XE

machine (grey case with slanty function keys across the top.) It only works correctly on the ATARI XF551 disk drive if you have an ATARI 130XE connected to it. DOS XE is the first DOS released by ATARI to support the concept of subdirectories and date stamping. Unfortunately, when using DOS XE with any other combination besides an ATARI 130XE and an ATARI XF551 disk drive, you seem to end up with a single sided, single density DOS with all of the overhead of subdirectories and date stamping thrown in. If I remember correctly, DOS XE was also divided into a three level tree of DOS menus: a directory menu, a utilities menu, and a file menu. DOS XE has the reputation of being an overly complicated dog of a DOS. I would tell you more about what DOS XE can do except I think I through the manual away (which came in the form of a paperback book). On the otherhand, I keep the ATARI DOS 2.5 and the MYDOS manuals close at hand. ATARI DOS XE was written as a collaboration between ATARI INC., and Bill Wilkinson founder of O.S.S., programmer of ATARI BASIC and the ACTION! computer language. I have always wondered to this day what the heck was going on at ATARI that created DOS XE. Suffice it to say, not many people find DOS XE useful. I think I have met maybe one programmer in fifty who uses it.

Well, that's about it for all of the officially released ATARI DOSes. Suprisingly enough, although the naming convetion for the XF551, like the designation for the 520STFM, implies that the disk drive unit is an XE Floppy Disk Drive 551 Unit, you do not need an ATARI 130XE to use a XF551 floppy disk drive in double sided (i.e. front and back), double density (double 128 or 256 bytes per disk sector) mode. Several non-ATARI DOSes will do this. For example, I am using an XF551 floppy disk drive in double sided, double density mode from a stock, unexpanded ATARI 800XL under MYDOS 4.5... but more on that at another time.

P.S. There is a RAM-disk driver built into ATARI DOS 2.5. If you own an unexpanded ATARI 800XL and have the DOS 2.5 RAM-disk program for the 800XL, you can create a single density RAM-disk of 105 SECTORS for use with text editors and terminal programs. (Even without this program it is possible to use the 800XL DOS 2.5 RAM-disk, but it is much harder to do so.)

4044. STart magazine suspends publication

Newsgroup: comp.sys.atari.8bit
Date: 1991-05-18 14:26:08 UTC
From: fseipel@magnus.acs.ohio-state.edu
Message-ID: <1991May18.142608.29749@magnus.acs.ohio-state.edu>
Source record: 114053

From Delphi msg 40954 in the Atari Forum,

40954 16-MAY 02:26 General Interest START and ANTIC dead
From: ANALOG4 To: ALL

This is a Z*BREAK SPECIAL NEWS BULLETIN:

Z*NET INTERNATIONAL ATARI NEWS SERVICE - Z*BREAK #91-20 - 5/15/91

START MAGAZINE CEASES PUBLICATION

After days of conflicting rumors, it was confirmed by START Magazine staff members today that the bi-monthly Atari magazine START will NOT publish another issue until further notice.

"STart has suspended publication pending a sale of the magazine," said Editor in Chief Tom Byron. A sale is said to be in the works with unidentified parties, and no timetable is being discussed publicly.

Byron also said that the next issue, the June/July edition, is complete and was waiting for printing when he got the news today that the suspension was in effect.

The resolution of the fates of subscribers and the many writers to whom STart has owed moneys dating back to mid 1990 is not known or predictable at this point. If STart is sold, it may be that those owed will be paid from the revenues, or the new owner may assume the liabilities of the company. A third possibility is that there would be a liquidation and sale of assets held by STart itself, which may be negligible.

Z*Net will continue to follow this story which is of great concern to the entire Atari community. STart is the last commercial "slick" magazine for the Atari in the U.S.A. It will leave behind only Atari Explorer, Atari's owned house magazine, and newspaper-type publications like AtariUser and ST INFORMER.

> would like to use them as a dumb terminal like VT100 or anything else
> that might work. Any suggestions?

XEP80 + VT100 hasn't been done. Kermit-65 comes close; it runs on the XEP80,
but there are a few quirks when doing VT100-type things on the right have of
the screen. So here again is my plea: Could some programmer out there
fix K-65 so it works right on the XEP80? I doubt it will take much work; the
problems seem relatively small. I don't even think you really need an XEP80 to
do it, since the XEP80 acts quite predictably as an 80-column E: device. K-65
just needs to be taught more thoroughly that lines are 80 columns long intead
of 40. The source code is available.

> BTW, I will soon be posting my emacs-like text editor using the XEP80
> if there is any interest. Please ack me via private mail.

As long as I'm posting, yes, please post!

You should be able to pipe these directly into inews (or rnews)
if you write a routine to reformat the date field, which is seriously
bad for Usenet. Send me mail so I can figure out a path to your .UUCP
site and I'll send you a C routine that will produce a correctly
formatted date field. Writing code to parse ``91May12 9:52 am''
shouldn't be very hard.

I'd also suggest that if Subject == ``[none]'' you should set
it to ``Gatewayed from Citadel network'', which is at least
informative.

This stuff would be piped directly into the newsgroup if I had an operable feed. At the moment I'm lacking a feed; I do not have an operating UUCICO program, nor do I have the necessary documentation to write one myself. Rewriting the date field isn't a big issue in any event. To send mail to my system, you can use any of the following paths:

mast.moundst.mn.org!blade!moonsweep!ranger [citadel]
over.mind.org!moonsweep!ranger [citadel]
theep.boston.ma.us!wildcat!moonsweep!ranger
alfalfa.com!pro-angmar!moonsweep!ranger

This is of course off topic in here...

4050. Help: Atari 65XE

Newsgroup: comp.sys.atari.8bit
Date: 1991-05-20 04:49:16 UTC
From: ringo@athena.mit.edu
Message-ID: <1991May20.044916.19321@athena.mit.edu>
Source record: 113973

I'm thinking about resurrecting an Atari 65XE for simple WP/Game purposes (it's my younger brother's you see...).

I'll need a color monitor & a printer, as he has the 5.25" drive.

What I'm looking for is suggestions/offers of items to buy re:
* a compatible color monitor
* a compatible printer, speed irrelevant, quality relevant
* software, especially of the WP/Spreadsheet variety
* Any other suggestions as to products which may still be available to make this a viable machine.

Any & all responses are greatly appreciated. Thanks, John K. '91

From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <42544@cup.portal.com>
Source record: 114054

This Press Release appeared this weekend on CompuServe. I'm reposting
it for anyone here who had a current subscription to STart magazine.

May 18, 1991

Unicorn Publications 3487 Braeburn Circle Ann Arbor, MI 48108

FOR IMMEDIATE RELEASE CONTACT: Pattie Rayl (313) 973-8825

TO: ALL STart Subscribers

UNICORN PUBLICATIONS OFFERS START SUBSCRIBERS DISCOUNT TRIAL SUBSCRIPTIONS TO
ATARI INTERFACE

Ann Arbor, MI -- Unicorn Publications, producer of Atari Interface magazine,
today announced special discount trial subscription rates for current STart
subscribers.

As most STart subscribers already know, Antic has ceased publication of
STart. This is a tremendous loss to the entire Atari community, and an even
greater loss to the many STart/Antic subscribers out there. With the loss of
STart, Atari Explorer and Atari Interface are the only commercially
internationally-distributed, US-based magazines left supporting Atari 8-bit,
ST and TT users.

In the past few years, Atarians have seen many of their favorite magazines
disappear from the shelves. In fact, a number of STart subscribers were
"converted" from ST-Log/Analog subscriptions.

Here at Unicorn Publications, we know how hard it is for Atarians to
commit to subscribing to an Atari publication nowadays. That's why we're
thankful for each and every one of our nearly 3,000 direct subscribers to
Atari Interface. That's also why we're offering trial six- and 12-month
subscriptions to Atari Interface at special prices ONLY for STart
subscribers.

For a limited time, current STart subscribers residing in the US can
subscribe to Atari Interface for only $12 for 12 issues (an $18 value).
That's right, only $1 per issue, delivered direct to your door! Plus, we'll
throw in an ST or 8-bit disk, absolutely FREE! [Special rates for Canadian
residents: $24 (regularly $30); Foreign residents: $30 (regularly $36). All
prices are in US funds.]

If you're just not ready to commit to a full year's subscription, we're
offering a special six-month (six issue) trial subscription for only $6. The
six-month subscription does not include a free disk.

To start receiving Atari Interface at this special trial rate, just send a copy of the mailing label from your last STart magazine, or a photocopy of the disk label from your last STart disk if you didn't save the magazine wrapper, along with a check or money order for the appropriate amount. If you're signing up for 12 months, don't forget to indicate whether you want an ST or 8-bit disk. Make checks payable to Atari Interface or Unicorn Publications.

This is a one-time-only offer to all current STart subscribers and does not apply to subscriptions to the Atari Interface ST or 8-bit Disks of the Month. This offer is good only until August 31, 1991. All subscriptions taking advantage of this offer must be postmarked by that date.

If you're still not convinced, we're willing to send you a recent copy of Atari Interface FREE OF CHARGE! Send us your name and address and we'll send you a copy of the magazine.

Unicorn Publications has been producing an Atari-specific publication since December 1987. Originally called Michigan Atari Magazine, Atari Interface currently has a monthly circulation of nearly 8,000 issues and is distributed world-wide. The magazine is currently available from most major bookstore chains (such as Walden's and B.Dalton's), independent bookstores/newsstands and from select Atari dealers across the US and Canada.

Bill & Pattie Rayl / Atari Interface

Sure, theres atartris, and Tetrix!
Both are good tetris clones.
Theres also "squares" which is in basic but stinks compared to the others.

Besides ATARTRIS and TETRIX, there is yet another decent Tetris clone for the 8-bit Atari: FORTRESS. My wife has played all three and seems to like FORTRESS best (she's much more of a Tetris fan than I am). I found all three of these on Delphi, so they're probably on the 'C' and 'G' services as well, and probably many BBSs. BTW, ATARTRIS has a bug - unless you have the patch installed, play with No Singles and you'll run afoul of it. As far as I know, the author has not released a new version of the program yet (the patch he posted on Delphi was in BASIC XE [XL?] which did us no good). Why my wife wanted to play with No Singles is another mystery :-)

I don't have ICD's address handy, but that's OK because what you really want is their BBS #. If you order through their BBS, you can get _any_ of their 8-bit products at 1/2 price, plus pay _no_ shipping. I found this out when I called their customer support line to ask about repairing/upgrading my old orange ACTION! cartridge - it started dying around last December, and lately has been completely unusable. ICD told me that they won't accept dead carts for an upgrade, and besides, they are having a 1/2 off sale on 8-bit stuff if ordered on their BBS. So I now have a new ACTION! cart (for $39.95 if I remember correctly) and I picked up the Sparta DOS Tool Kit also.

Their BBS # is: (815) 968-2229

Sure it does. I am using a 400 with only 16 KB, a 1050 drive and DOS 2.5,
and it works. However, after loading DOS there is not much space left for
anything... :(

Source record: 113968

Hi. I'm currently using MidiTrack III with my Midimate interface on my Atari 130XE. The sequencer in MT III is pretty lousy, so I was planning on writing a few supplementary MIDI utilities (event editor, maybe a score entering/printing utility, etc.). I would also like to convert my Music Composer files to MIDI format. My problem is that the MT III manual says nothing about disk format, except that only one song is stored on a disk, along with the actual MT III code. Does anyone know how the disk format for MT III works? Or alternatively, has anyone out there already written some MIDI utilities for the Atari 8-bits?

-Al

4066. IBM server for 8-bit

Newsgroup: comp.sys.atari.8bit
Date: 1991-05-23 18:59:02 UTC
From: bkd3019@rouge.usl.edu
Message-ID: <31638@rouge.usl.edu>
Source record: 113967

About six months ago I remember seeing some software posted here for the purpose of using an IBM-PC as a disk server for an atari 8-bit. Since I have bunches of old software on disks that are deteriorating, and would like the convienience of putting all the stuff on the hard drive of my PC, can anyone point me to the source of the information. I should mention that while I have the ability to transfer files with the PC, the 8-bit dosen't have any way of transfering files at the moment. If this thing works, I'll have an extra 1050 drive that I'd be glad to get rid of real cheap...

Thanks in advance,
Brian

4071. Best characters to use in Ultima 3?

Newsgroup: comp.sys.atari.8bit
Date: 1991-05-28 06:46:26 UTC
From: lord_zar@ucrmath.ucr.edu
Message-ID: <14756@ucrmath.ucr.edu>
Source record: 113975
Cross-posted to: comp.sys.atari.8bit,comp.sys.apple2,comp.sys.cbm

First off, this is cross-posted to the following groups:
comp.sys.amiga.games & rec.games.misc (a few days ago)
comp.sys.apple2, comp.sys.atari.8bit, comp.sys.cbm (today, monday night)
(The second line of newsgroups was added after I, in my idiocy, neglected
to consider that some readers of c.s.apple2, atari.8bit, and cbm might not
know computer games are talked about in rec.games.misc)
NO COMPUTER WARS, OKAY?

So: start posting! Ultimas I-V appeared on the C-64 and apple2, and Ultimas
I-IV appeared on the atari series, so there should be more responses this
time around!!!

Now then, I'd like to know what parties net-land considers to be the best to
win with, and if using one party the entire game is good, compared to using
a party with expendable members like mages and clerics (to go up and down
dungeon levels at 1st level) and replacing them later.

I'll post what party I and my friend are using after I see everyone's 'favorite'
or 'fun' party.

Also: evaluate each class, if only to show why you wouldn't use that class,
as well as the ones you do use.

Wayne

4072. A lot of Atari 8 bit stuff for sale

Newsgroup: comp.sys.atari.8bit

From: Ordania-DM@cup.portal.com
Message-ID: <42747@cup.portal.com>
Source record: 113979

Well, I've finally gotten around to buying a new computer, and in order to afford this new habit, I have been informed by my spouse that I need to alleviate myself of excess junk. In other words, "GET THIS JUNK OUTA HERE!" :) Now, of course, Atari 8-bit stuff is NOT junk, but I do have a wee bit of it, and since I'm unlikely to use all of it, I'm selling most of it off.
Listed below is everything that I am selling, with prices. Anything with a number in parenthesis after it means I have that number of those items. If you don't like my prices, feel free to make an offer, the worst I'll do is politely turn you down. The items listed together for one price are meant to be sold as a group, if noone makes a reasonable offer on them, I'll consider breaking them apart. The prices do not include shipping. If you have any questions about the items, feel free to ask.

Computers:

$50 800xl - standard

$75 800xl - hacker: RAM OS Switch, D6 & D7 pages usable as ram
External keyboard attached (NOT the upgrade)

$40 800xl - broken keyboard

$40 Atari 130xe - broken, with 4 keyboards (all broken)

$25 Atari 800, w/48k

$15 Atari 400, w/16k

$25 1200XL mother board (4)

Disk Drives:

$150 XF551 DDDS Disk Drive, Upgrade rom for 3.5" disk drive installed.

$125 Indus GT DDSS Disk Drive, with write-protect switch (ask)

$85 1050 EDSS Disk Drive

$15 Atari 810, broken

Peripherals, High End:

$400 ICD 256k MIO, 20 MB Hard Disk, SCSI-ST506 HD interface,
Power Supply & Case, SCSI cable, 130XE-MIO interface

$200 Magnavox RGB Display 80, XEP80 80-column/Printer Interface,
video cables, & switch box (to switch between 40/80 column modes)

$80 Atari 850 RS232 interface

Peripherals, Low End:

$20 Atari 1030 modem

$25 Atari direct connect Seikosha printer (slow, but it works)

$10 Alien Voicebox (doesn't work, don't know why)
$10 Atari 825 printer

$5 Standard 410
$2 Standard 410 - missing cassette cover
$4 Atari 1010 - pause button broken off, no power supply
$2 Unusual 410 - requires 6v DC input, no power supply

Connectors:

$10 Trackballs (2)

$2 Keypads (3, from 2600 Star Raiders Game)

$15 CX85 Keypad

$1 Joysticks, broken (lots)

$5 Paddles (4)

That's the end of the hardware, now for the list of software:

Cartridge languages:
$50 SpartaDOS X - latest revision
$35 RTime-8 - with battery socket

$50 Basic XE/Mac 65 - single cart, no case
$30 Basic XL
$15 Action - no docs
$15 Atari Assembler
$5 Atari Basic

Cartridge games:
$10 Adventure Creator
$10 Battlezone
$5 Super Breakout
$5 Centipede
$5 Pacman
$5 Star Raiders (2)
$5 Digdug
$5 Missile Command
$5 Jungle Hunt
$5 Qbert
$5 Gridrunner
$5 Miner 2049er
$5 Robotron
$5 Serpentine
$5 Star Trek

$5 Computer Chess
$5 Defender
$5 Jumpman Jr.
$5 Jumbo Jet Pilot

Miscellaneous Cartridges:
$5 Atari Artist
$5 Education System Master Cartridge
$5 400/800 Diagnostic Cart

Disk Software:
$10 Adventure Writer
$10 Ultima II (missing map)
$5 Superman
$10 Ghost Busters
$10 Mail Order Monsters
$10 Seven Cities of Gold
$10 Spy Versus Spy, Volumes I & II
$5 Boulder Dash Construction Set
$5 Antic MAPWARE
$5 Antic RAMbrandt
$5 Murder on the Zinderneuf
$5 The Wizard and the Princess (hi-res adventure #2)
$5 Lepus Revenge
$5 Home Financial Management
$10 SmartDOS
$5 Atari Word Processor disks
$1 Atari DOS 3 (2)
$3 Antic DISK, July 1983
$3 Antic DISK, November 1980
$3 Antic DISK, Feb/Mar 1990
$3 Analog DISK, July 1988
$5 Filemanager 800+

Tape Software:

$5 Tanktics
$15 Telengard, Andromeda Conquest, Shamus, Conflict 2500,
B-1 Nuclear Bomber, Galaxy, Voyager 1, Roadracer/Bowler,
101 Programming Tips & Tricks, Introduction to Sound,
Introduction to Graphics, Writing Programs Two, Super Cubes & Slip

Literature/Documentation:
$15 Mapping the Atari, revised edition
$15 De Re Atari
$7 Compute's Second Book of Atari
$10 Compute's Third Book of Atari
$10 Machine Language for Beginners (2)
$10 The second book of Machine Language
$10 The Atari Basic Source Book
$10 Inside Atari DOS
$5 Programmers Reference Guide for the Atari 400/800 Computers

$5 Your Atari Computer (good reference guide)

$5 Atari Roots (guide to machine language)
$5 The Atari Assembler
$10 6502 Applications - Rodney Zaks
$15 6502 Assembly Language Programming - Lance Leventhal
$19 6502 Assembly Language Subroutines - Lance Leventhal
$10 Top Down Assembly Language Programming for the 6502 - Ken Skier

$5 Inside Atari Basic
$5 Basic Exercises for the Atari
$5 Atari Programming with 55 programs

$5 Forth on the Atari
$5 Program Descriptions 1 (for Hofacker software on your atari computer)

$5 Visicalc package (no disk)

Well, that's all of it, almost... I have have a ton of paperwork (magazines, copied articles, etc), a bunch of junk that I didn't bother listing, and about 100 disks filled with PD stuff. If you don't see something you want, just ask, I might actually have it. Also, if you buy a lot, I'm willing to give you a discount (the size of the discount depends on how much you buy :).

Anyway, if you are interested in any of this, here is my address & phone:

Charles Hughes
555 E. Washington Ave, Apt #301
Sunnyvale, CA 94086

Message-ID: <2970002@hpsmo100.rose.hp.com>
Source record: 113983

Here's a real old bit of ATARI trivia... Does anyone remember the Atari 815 dual disc drive? It looked like a tall 810 and had two drives mounted inside of the case. They never shipped, but I saw some at an early 80's CES show. Rumor had it that some units had found their way into the hands of some users for testing. If you found one now, it might be a real conversation piece.

Another product that never made it was the Atari lightpen that was announced with the inital release of the Atari 400/800. Atari's legal department stopped them from ever shipping due to fear of lawsuits. They weren't to keen on the idea of kids poking at the picture tube with a pointy wand.

The famous (or infamous) Atari 410 cassette recorder was produced in no less than three different versions. All it really was was a conventional tape deck with the audio portion removed and some interface circuitry to tie it to the computer. I saw at least three different versions, all with the 410 model number. The only think they had in common was that they were all beige.

I remember the excitement I felt way back in late '79, (or was it early '80) when I bought my Atari 800 with 8k of ram, a 410 tape drive, and a Star Raiders cartridge. As I recall it cost about $1100 back then.

> make this a viable machine.
>
> Any & all responses are greatly appreciated. Thanks, John K. '91

John, you can write me as Craigr@athena (on your system)
I can help you if you are still in the MIT area.
You dont need a color monitor, but you will need a tv set.
Ataris work on tvs quite well just like any other system that can
utilize a standard game/tv switchbox.
Any printer is compatable. Just get a 850/mio/or PR connection.
That will let you use whatever printer you want.
If not use an atari direct connect printer, but I dont recommend
any of them... especially the 1027..
Software? No problem. Can you send me email and ill send you my #
then you can call me and dl textpro from me.
Ive got a lot of things youd want to keep your atari up to date.
Theres still quite a lot of shareware still being made.
-craig

ATari part # 61982
Power supply dv-512cm
Input 120v ac 60hz 40w
output +5v dc 1.5a

Hope this helps, thats what I see when I look at mine.

4078. Re: Best characters to use in Ultima 3?

Newsgroup: comp.sys.atari.8bit
Date: 1991-05-29 11:21:09 UTC
From: andrewh@msb.com
Message-ID: <1991May29.112109.7903@msb.com>
Source record: 113980
Cross-posted to: comp.sys.atari.8bit,comp.sys.apple2,comp.sys.cbm,comp.sys.amiga.games,rec.games.misc

In Ultima 3, I find at least one elven thief to be indispensable in the party until the final battle. Since I typically give them a higher Dex., they have a higher probability of hitting things. A dwarven/hobbit Paladin (just as long as their wisdom and strength have a max of 75 and/or 99) or a human Ranger, a fuzzy/elven Magic User, and a hobbit Cleric is a typical dungeon party. At the very beginning, I might have a hobbit Druid instead of cleric until I can get the money to boost their stats. At the final battle, my "perfect" party consists of an elven wizard, a fuzzy wizard, a hobbit druid, and a hobbit cleric. Those who made it to the end know what I mean!

4079. Age old question

Newsgroup: comp.sys.atari.8bit

Message-ID: <1991May29.190248.4551@ux1.cso.uiuc.edu>
Source record: 113982

I am sure this has been asked before, so I am sorry for the repetition..
but, does anyone have, or know where I can get my hands on the Atari 800
memory map, or OS details or anything along those lines. I have Mapping
the Atari, but am looking for something more...

Also, does anyone have the source codes for any decent, 'old' games. I
do not see why any manufacturer would care about keeping it private
(its not like Epyx is going to make any more money off of Jump-Man..)

Maybe I will just call Epyx myself and see if they will give it to me..
(are they still in business..)

Thanks

Steve Dillinger

4081. ICD Sells Out its 8-bit line, including rights

Newsgroup: comp.sys.atari.8bit
Date: 1991-05-30 00:50:25 UTC
From: fseipel@magnus.acs.ohio-state.edu
Message-ID: <1991May30.005025.28858@magnus.acs.ohio-state.edu>
Source record: 113985

A.C.E.C. BBS (614) 471-8559 3oo/12oo/24oo bps
Serving the 8-bit community since 1984

Pandora BBS (614) 471-9209 3oo/12oo bps
Full access to hundreds of public domain downloads on both BBS's.

The following is from the ICD BBS, 815-968-2229:

ICD 8-Bit Blowout Sale

Yes, it's true. The time has finally arrived for ICD to clear out the 800/XL/XE 8-Bit line of products, dust off the shelves and make room for more inventory. Our basic reason for this sale is that we can no longer show any profit margins for these products, nor produce any large quantities to keep in stock, but we can and will continue to support the end-users.

Because of Atari's decision to drop the XL/XE line, followed immediately by the decline and fall of 8-Bit support throughout the national dealer community, ICD must close out our complete stock of 8-Bit products, including both the OSS, Inc., and ICD, Inc. lines. However, we will continue to provide quality technical support during the warranty period of these close-out products.

As heartbreaking as this news may be to you and us, the truth is that it had to happen sooner or later. To be honest, it was later. We at ICD, long supporters of the 8-Bit Atari community, have held out for as long as we possibly could manage. There is, however, one bright note in this sale. It is YOU, the end-user, who benefits from the Super ICD Blowout Clearance Sale!

Our entire stock of 8-Bit items, including spare manuals, parts, pieces, and assorted used equipment, must go now! For information on purchasing parts and assorted components to these products, call ICD voice at (815) 968-2228.

Everything from our door-opening US Doublers and SpartaDOS, the complete line of OSS programming languages (including Personal Pascal for the Atari ST, the only ICD ST product included in his sale), all the way up the line to our Multi I/O (MIO) interfaces and the all-new SpartaDOS X cartridge.

We are determined to see that you have the products that you need to survive, so rather than drop the line completely and toss all of our hard work into a dusty corner, we also intend to sell the rights to these products! Once the rights have been sold, the new owner(s) can continue to manufacture all these superior products just for you. If you are interested

in the rights to these items, please call ICD voice to discuss terms.

Have you been looking high and low for your ICD product manual? Is your copy bent, folded, stapled, mutilated, torn up and dog-eared? For that matter, did your dog eat it? Have you taken so many notes in it that you can't read the original text? It doesn't matter! Whatever reason you have for wanting a new manual, now is the time to get your new copy. We have a few spares, and they are now on sale!

Never underestimate the power of your Atari 8-Bit computer system, regardless of which one you own. These systems have been well developed, and frankly, are the most researched and documented home computer systems available. There has never been a more widespread appreciation for these computers. They were the "Cutting Edge" in their time, and still are for the new computer user. These systems are excellent starter systems, perfect for the children of the die-hard club.

Unfortunately for all of us, those in Atari Corp that make the decisions sometimes do so in haste. This, then, directly affects dedicated 8-Bit users, and we come full circle to where we are today...suffering withdrawal symptoms.

Suffer no more! ICD is offering you one final chance to own those products that you have been saving your hard-earned pennies for, for so long. There are litterally thousands of folks out there that have learned to use these systems, and are willing to assist you in every effort to learn and understand them, not counting ICD. This is your last chance to buy them from ICD! Once our stock is depleted, your chance is gone.

Almost all of these products are now on sale at over 50% off! Get them while they are available. This sale will end sooner than you think since products will now be in demand at these prices. Don't wait! You've been warned!

You can order these items on the ICD Support BBS (815-968-2229), where the sale prices are ALREADY on-line! Please don't ask if you can get any better prices. You can't...anywhere! The prices listed are already over 50% off!

How To Place Your ICD Sale Order

Mail Orders: To order by mail (Pre-Pay), and pay no shipping charges, simply complete the order form below, and mail it with your enclosed payment to:

ICD, Incorporated
ATTN: 8-Bit Sale
1220 Rock Street
Rockford, Il.
61101.

BBS Orders: Ordering On The BBS is as simple as calling the ICD BBS at 815-968-2229 and placing the orders while on-line (Option-$ from the main

menu), 24 hours a day. You can use VISA, MasterCard or COD payment methods on the BBS as well as phone orders.

FREE SHIPPING WITH PRE-PAID MAIL AND BBS CREDIT CARD ORDERS!

Phone Orders: Phone orders are welcome Monday through Friday, 8 a.m. to 5 p.m. CST by calling 815-968-2228. All COD phone orders will include a nominal shipping and handling charge.

Payment: Please include full payment with all mail orders. Illinois residents add 6.25% sales tax. If ordering COD, you must call for a quote on shipping costs. No personal checks will be accepted on COD orders (cash or money orders only). Refused orders will be subject to a $15.00 service charge.

Shipping: Orders are shipped UPS whenever available. For prompt delivery, please be sure to give us your complete street address (no P.O. Box numbers are allowed by UPS). Additional shipping charges are required outside the continental U.S.A. Please call ICD for further shipping instructions.

I find that with Ultimas II through V, Copy II Plus makes the best companion on the quests! (It won't work on Ultima I) Just do a little sector editing when you get in a jam.

Cheat? Me? No! I went through all once without cheating...I just raised my stats the second time to get to the good stuff faster.

A few tips...
^L
Ultima I: Go in the dungeon's a lot...
Ultima II: Don't bother going in dungoen's...you don't have to...I didn't.
Ultima III: Use the same guys and have them ALL get marked with burns.
Ultima IV: NightShade (I think) is available on the island near in the lake up in the northeast corner. Midnight only.
Ultima V: Geesh...I can't think of anything really...
Ultima VI: Write to Origin! They make it for the Commodore 64 even! Don't you think Apple comes BEFORE Commodore?! I do! WRITE!
Ultima VII: I wish I could do like the box says and star in this Ultima but I don't want to buy an IBM or Commie Ultima VI to find out how!

-Lazer

Some interesting trivia, but I have one correction: Atari finally DID release a lightpen (I used to have one). I think they did so in '84. It came with its own special cartridge drawing program, which was really quite nice (IMHO). I was impressed at the time that they hadn't merely repackaged Koala Paint, as they had done for the Atari Touch Tablet. Speaking of light pens, you can make your own: There was an article on the subject in a very early issue of Creative Computing (now defunct). It may have been 1981. Then there was the Atari Paint program, which used a joystick for input.

The code names for the original Atari 4oo and 8oo were Colleen and Candy.

Thats funny, I own an Atari light-pen... It works great, too! It never fails to impress people about the capabilities of an Atari. It comes with a really neat drawing program (AtariGraphics, I believe), complete with pop-up windows and special "star-trek" sound effects... I believe it came out shortly after the 600XL and 800XL were introduced, although my memory is fading...

Speaking of old Atari equipment, does anyone remember the ATR8000? I had one, and it was a real blessing. It was a Z80 based CP/M expander for the Atari, though I never used it for CP/M. I used it for the built in disk drive interface which allowed me to use standard disk drives with my Atari, the RS232 port for modem and printer, etc. I had mine with two Shugart DS/DD 5.25 inch floppy drives. It was an interesting piece of equipment.

Also, does anyone still have copies of the COMPUTE! series of books on the Atari 8bits? I remember Inside Atari and a couple others... they were really great. Too bad you can't get inside information like that for todays computers so cheaply! (the Mac I'm on now, for example!)

This sounds like the 800XL power supply. I remember the original
800 power supply being an AC output, with the DC rectifier being on
the power supply board in the computer. Sorry I don't remember what
the voltage is.

I had an Atari 400 whose power supply died. I recall being able to use
the power supply from my 1050 drive instead (the connectors were the same,
and as I recall the voltage specs were similar also). I believe it was
9 volts AC. I don't know if this is the same as the 800, though.

The software was done by Steve Gibson, one of the truly visionary pioneers
of the personal computer era. The drawing program was at the time considered
to have on of the most advanced user interfaces yet seen for any PC.

Source record: 113996

Rensselaer Polytechnic Institute sponsored or co-sponsored a scholarship back in 1981 which gave COMPLETE Atari 800 systems with 48K memory, an 850 interface, two 810 drives, the 830 (?) 300-baud acoustic modem, some cartridges (BASIC, Star Raiders, Telelink I, Assembler/Editor), a bunch of manuals including a release of the Technical Reference Notes so early that the Table of Contents didn't have Page Numbers in it, a Beta release of "Atari Pascal" on four 5.25" diskettes, and I forget what all else. One of the professors who administered the program had an 815 disk drive in his office; for all I know it might still be there gathering dust. The catch was that the students had to actually GRADUATE from RPI in order to KEEP the system; if they flunked or dropped out they had to give it back! My girlfriend-at-that-time survived RPI and still has that Atari system (and yes, it DID cost about $1100 at that time). Oh, yeah, the system also included an Epson printer and a TV (not monitor; you could watch color TV when you weren't computing)! My SAT scores were probably good enough that if I hadn't waited til the last day of admissions to APPLY to RPI, I might have gotten one of these scholarships, and if I had, the thought of KEEPING it might have kept met at RPI for four years (as it was, I left after 2.5 years). My life would have been VERY dif-ferent and I wouldn't be here telling you this right now!

Yes. The program ATARIO for the IBM-PC will allow the PC to read/write Atari DOUBLE DENSITY floppies. Caveats:

* Only works with "low density" (i.e. "360K") IBM drives.

* Only reads/writes DOUBLE DENSITY (i.e. "US Doubler" or other "true double density") Atari disks

* Has some quirks/bugs which have not (to my knowledge) been quantified.

Perks:

* Source code is available: application is in C, Atari-format driver is in assembler

* Works on PC and at least the Tandy 1000SL "clone"; probably on anything.

Not sure where you can GET this program, other than rousing me (very difficult most of the time) to UUencode and ship MY copies of all this.

I made it to the end, I don't know why you need different parties. Or
why do you need so much magic users. Have you ever considered taking a
horse with you into Exodus' castle? You only have to fight dragons two times
then, instead of four times.

It seems you all have many problems playing Ultima III, but it is such an easy
and uncomplicated game...
Later, every party member is as powerful as the other. Every character has
his maximum stats...

Why do you all have problems? I don't know...

I believe I know which article you're talking about. I have that Creative Computing issue. It is March 1983, in the "Outpost: Atari" article. It mainly talks about how to make a home-made Atari light pen, and gives a couple sample BASIC programs you can use with it.

What is surprising is this is an issue of Creative Computing that I just happened to look at and pick up one day. You are the second person I have heard refer to this article (I think you were referring to this one) after all these years.

>>a joystick for input.

>I believe I know which article you're talking about. I have that Creative
>Computing issue. It is March 1983, in the "Outpost: Atari" article. It
>mainly talks about how to make a home-made Atari light pen, and gives a
>couple sample BASIC programs you can use with it.

>What is surprising is this is an issue of Creative Computing that I just
>happened to look at and pick up one day. You are the second person I have
>heard refer to this article (I think you were referring to this one) after
>all these years.

I built this lightpen. You mention that you "just happened to look at and
pick up" this issue of Creative Computing; similarly, I was browsing through
back issues at the library. What was a bit annoying was that the pinouts
given for the lightpen were REVERSED; this was not mentioned until a few months
later in another issue. But since I was looking through back issues at the
library anyway, it wasn't until about 2 years later that I happened to
stumble upon that correction article, during which time the lightpen had been
scrapped, rebuilt a few months later exactly as per (incorrect) instructions,
failed again, scrapped, rebuilt, failed...

When I finally found the correction article and got the lightpen working,
though, it was less than impressive. The vertical resolution was perhaps
fine enough for vertical discrimination among the 24 different graphics 0
lines; horizontal resolution was nowhere near being able to pinpoint which of
the 40 columns you had the pen pointed at. And for drawing, the pen was pretty
much useless. They included a sample drawing program in graphics 7. Vertical
resolution was almost acceptable, but the horizontal resolution was so poor
that you would get a point +/- about 40 pixels from where you were, which in
graphics 7 is abysmal. The article did mention that horizontal resolution was
poor, but I didn't expect it to be that poor. Did anyone else have better
results with this lightpen?

Ah, the days when you could build your own computer peripherals and easily
interface them... what memories...

Sorry, but that's not true. It really was just two 810 drives stuffed together.
DOS 2.0D was written to deal with the two drives in one box, it was definitely
NOT double density.

How do I know? I was one of the few people who had one to play with. :-)

I recently got back into my Atari stuff after I bought a 1200XL and
1050 Disk Drive for $20.00 from the Communications department here.

The Problem is, I never had a printer when I was in Jr. High, so I am
now trying to hook one up. Here is the setup I am working with...

1200XL computer
1050 Disk Drive
(3) XLP Ape Face Interfaces
12XLP Ape Face Interface (w/o power cable)
ATARIWRITER (cart)
Gemeni 15 printer (serial and parallel inputs)

I hooked it up, and it told me that there was no device available.

I just wanted to let everybody know that I had intended to misinform anybody.
I was just quoting what I _thought_ I remembered reading in a Creative
Computing article from long ago. CC really was an outstanding magazine. When
it died, a couple of the editors went on to work for Atari's own magazine
(Atari Explorer?). Atari canned them about 9 months ago and hired a new staff.
Have any of you heard anything about what the previous editors are up to
these days?

John Thaanum thaanuj@prism.cs.orst.edu

4100. Current Notes/Dave Small query

Newsgroup: comp.sys.atari.8bit
Date: 1991-06-04 23:15:59 UTC
From: wilmott@utopia.rutgers.edu
Message-ID: <Jun.4.19.15.50.1991.2146@utopia.rutgers.edu>
Source record: 113806
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

I was just reading through the latest issue of Current Notes, specifically the article by Dave Small. I thought it was a very good article; very daring of him to write it, and it definitely made me stop and think about the topic...

Anyway, my quick question for those of you who have read the article and might [think they] know the answer - what company, and which early 80's 8-bit programmers was Dave talking about specifically? I have been around the Atari community for 10 years, so I probably will recognize the names, but I can't think of who they might be offhand.

Please limit any replies to this message to e-mail rather than posting...I do not wish to stir up a lot of muck within the newsgroups. Thanks.

For what it's worth, I picked up some third-party commercial light-pen at a local user-group flea market a couple of months ago, got it to work, and had the SAME experience of totally useless horizontal resolution: "picking a pixel +/- 40 pixels away from where you were pointing" sounds about right...

Must be the Atari hardware. :-(

I don't think it's the atari hardware because I got the atari "light
gun" from a friend and wrote a little c program to "shoot" at the
screen machine gun style. The gun IS a light pen and seems pretty
accurate (+-2 or 3 pixels) even from a distance of 15 feet away!

There a small algorithm necessary to map the light pen coordinates
to screen coordinates, it can be found in the technical reference
manual. If anyone needs it I would be happy to look it up and
post it. Also I would also be willing to post the C source for
MACHINE GUN (DEEP BLUE C). It's not very good from a game standpoint,
or from a C progamming standpoint (kludgey code), but it does work
and could be used to test the accuracy of your light pen hardware.

I also (once upon a time) had a KOALA lightpen with KOALA paint
for pen. When you started KOALA for pen, it would have you
"calibrate" the pen by pointing at a horizontal and then a vertical
line. It also was quite accurate once calibration was completed.

Hmmm... I stopped keeping track of what Atari was doing about the time the Atari 1200 came out. (I couln't forgive them for going down to only two joystick ports!) So it looks like they did finally release the lightpen...

Another interesting factoid... You probably knew of six slots that the 800 had for expansion. There were two cartridge slots, one OS slot, and three memory slots. But did you know that there was a seventh slot buried deep inside the machine. And plugged into that slot was the processor card that contained the 6502 and it's support chips. Rumor was that the reason for putting the processor on a card would be to allow future versions that used the same bus, I/O, and graphics, but a different processor.

I knew about the Coleen and Candy code names (You can find reference to that in the technical manuals if you can find copies) But did you know who Coleen and Candy were? Supposedly they were two well-endowed secretaries who worked at Atari.

Do you all remember the CTIA chip that produced the graphics? CTIA stood for Computer Television Interface Adapter. More interesting was the naming of it's sequal: GTIA which stood for George's Television...

Minor technical question here: How does the computer know when a cartridge is or is not going to supply the data for a memory access... To explain better what I mean, I will give the context of my question: The SpartaDOS X cartridge (I assume, I don't have the cart yet) can make itself virtually invisible to the computer so that RAM underneath can be accessed. How exactly does the computer know to use internal RAM rather than the cartridge ROM? Ooops, in thinking about how to write this question, I think I answered my own question... Well, someone can confirm it for me :). There is a line on the cartridge port that is held high (or low) when the cartridge wants the data bus, right?

I own an Atari 815 disk drive. It has 2 SSDD disk drives. The format is
different from all double density drive that followed. Atari had a special
version of thier DOS II (not DOS2.0) that worked with the drive. They were
unable to manufacture a reliable product due to poor design.
>
>Another product that never made it was the Atari lightpen that was announced

The original light pen made it as far as the Atari company store. I purchaced
one the first day they showed up in the store for a friend. He had purchaced
my 1 week old 400 so I could buy a 800. I took the light pen home that first
night and had a blast. I gave the light pen to him the next day and he
brought it back the next day with the 400. The light pen would not work on
the 400, but it worked fine on my 800. I had become friends with some
of the techs at the service dept when the 400 failed the first night with
a bad ctia. I took the 400 out to Atari and watched as they worked on the
machine. The problem turned out to be the trace for the light pin that went
to joystick port 1 on the 800 went to port 4 on the 400. As it turned out,
no one at Atari had tested the light pen on anything but an 800. In the
manufacturing process, this function was tested. Because every 400 failed
this test, they assumed the test was bad and ignored it. Because all the
cases of light pens in the warehouse had docs that said to use port 1,
they held up shipment. To my knowledge, none of these light pens ever
shipped. The light pen that came out a few years later was completely
redesigned.

Here here!

The 800 Keyboard is by far the best.
Anyone out here know how to get ahold of ANTIC MAG.?
Also, Im looking for CARINA BBS program, and info on these would be great!

Thanks, from the land of the blue ski and the big fish!

4119. VT100 terminal emulator uses XEP80!

Newsgroup: comp.sys.atari.8bit
Date: 1991-06-07 01:39:44 UTC
From: marcotte@unixland.natick.ma.us
Message-ID: <1991Jun7.013944.6357@unixland.natick.ma.us>
Source record: 113817

A short time ago, someone wrote asking about the
availability of a VT100 terminal emulator that
works with the XEP80 80 column unit. He was told
that VT100/XEP80 had not yet been done. Well,
I am happy to report that it has indeed been done
and done well at that! The product is called
VT-850 and was written by Curtis Laser. It is
available from GEnie and CompuServe. The latest
revision is B1. To get the full benefit of the
program, documentation is necessary which is
available from the author for a minimum shareware
donation of $10. I recommend sending more because
the program is worth it (I am using it now).
If you have questions please call Curtis directly:

4120. Repairing a 130XE keyboard

Newsgroup: comp.sys.atari.8bit
Date: 1991-06-07 03:09:50 UTC
From: marcotte@unixland.natick.ma.us
Message-ID: <1991Jun7.030950.7530@unixland.natick.ma.us>
Source record: 113818

Recently a particular key on my 130XE keyboard stopped working.
Rather than replace the entire keyboard, I took it apart to
see if I could fix it. After unscrewing the keyboard (lots
of little tiny screws) I discovered a plastic flexible
membrane with conductive traces on it. One of the traces
near the key that was not working was flaked off causing an
open circuit. My solution was to purchase Burglar Alarm
Window Foil conductive tape from Radio Shack (Cat.# 49-502,
120 ft for around $6). I peeled a small piece of the
conductive tape off and cut it to shape and then applied it
to the open trace effectively "soldering" it together.
Now the key works again. This technique could be used
to fix any open circuit problems on the keyboard membrane
without having to order new parts. Hope this helps someone
out there revive an ailing keyboard!!

4121. Modem use on 800XL

Newsgroup: comp.sys.atari.8bit
Date: 1991-06-07 11:35:41 UTC
From: monacell@oasys.dt.navy.mil
Message-ID: <8247@oasys.dt.navy.mil>
Source record: 113819

I have had an 800XL system for many years but I have never used a modem. Recently, a friend offered me the loan of an RS232 modem so that I can see what I'm missing!

I am told that I need an 850 interface or a P:R:Connection, each of which apparently has an RS232 port, in order to use the modem. Can anyone suggest where I can get these, preferably used? I don't want to make a big investment just to try a modem. Also, what kind of cable is needed to connect the modem to the port on the 850 or P:R:Connection?

I'm not a sophisticated user, so I aplogize in advance for what are probably trivial questions. Thanks.

It was awfully good.. my own 8 bit machine is a 800- the 130 XE
keyboard was (IMHO) awful. But I really loved the soft-touch 1200XL keyboard.
I'm no touch typist, no I won't go farther than that, but the soft-touch
feel of the 1200XL keyboard I have never seen in any other keyboard ever
in any other computer. I sure would have loved to see what the mechanism
looked like......

>5.25 inch floppy drives. It was an interesting piece of equipment.

A mixed blessing, surely. If you never used it for CP/M, then you
probably were able to avoid most of the severe drawbacks of the system.
I would have, but I didn't want to spring for a copy of MYDOS. At the time,
MYDOS was the only thing available which had the necessary software to allow
an Atari to use the RS232 port on the ATR8000. Not wanting to waste money on
yet another DOS (I already had OS/A+ DOS version 2 and 4, as well as a bootleg
of Atari DOS V. 2), I was forced to use the CP/M terminal emulator program
in order to be able to use the RS232 port to attach a modem.

OK, so what's the problem? Well, the CP/M or whatever was controlling
the disk drives when CP/M was running was one of the most amazingly poor
pieces of engineering I had encountered to that point. I used that system for
I guess the better part of a year. I was barely able to keep my software
intact, though, as it usually took little longer for a given copy of my CP/M
system disk to become unreadable than it did for me to make a new backup. I
had this happen at least four times. This part of the ATR system was quite
unimpressive. I will agree, though, that it was a hell of a nice system as
far as its control of disk drives for Atari format usage, as well as a nice
big printer buffer.

4124. Using NEC 3550 Printer with P:R Interface

Newsgroup: comp.sys.atari.8bit
Date: 1991-06-07 21:49:06 UTC
From: deg@sei.cmu.edu
Message-ID: <26715@as0c.sei.cmu.edu>
Source record: 113821

I'm the happy(!?) owner of the above letter-quality parallel printer. My problem? It works well with IBM-compatible PCs, but doesn't understand my 130XE via a P:R Connection interface.

The P:R works well with a Gemini 10X parallel printer, so I assume the internal ok/not-ok-to-print logic should work. However, the NEC printer will randomly print/not print characters, and sometimes print trash, almost as if it were a serial printer running at the wrong baud rate!

Has anyone out there used this printer, or perhaps an Anderson-Jacobson or Diablo daisy-wheel printer? If so I sure could use some pointers in making it work.

Also, assuming the printer can be made to work, am I right in expecting that the P:R will take care of any return/linefeed concerns?

Lastly, can anyone share documentation on this beast? It's supposed to be able to do bold, proportional, pica, elite, and the rest of those neat formatting things a daisy wheel/thimble/petal printer can do, and I have NO documentation at all.

Thanks for your help,

Don

Another method of repairing the xe keyboard.

I had a much worse problem. A whole 8 Oz. Glass of water was dumped into
the keyboard. The foil traces were all but destroyed.
I Used REAR WINDOW DEFOGGER Repair, a conductive paint that you can get
at most Auto Parts stores. It was a job, but it did work.

There are other Conductive paints on the market, which may even work better.

I wouldn't hold your breath. :)

Zmodem, like all windowed protocols, requires that the computer can talk to the modem and talk to the drive at the same time. That's possible under some circumstances, like using a MIO serial port or a ramdisk. But for most people who have SIO modems and drives, it's pretty much impossible.

Someone might write it, but it would be wierd. Zmodem is a lot more complex to implement than, say, Ymodem, it gives only slightly better performance, and it would only work on a very small subset of Atari 8bit systems. Who'd bother?

Tom

>then, instead of four times.

At the beginning, just staying alive is most important; otherwise you go
through a lot more characters. And yes, I have brought horses into the castle,
which allowed me to evade the initial guards, but without diagonal movement,
you will find it very difficult to evade the dragons, if at all (the clerics
came in handy then). It's not necessary to enter the castle with a magician-
heavy party (I've done it with different parties) but it helps.
>
>It seems you all have many problems playing Ultima III, but it is such an easy

Not quite. In Exodus' castle those characters that depend on weapons
proficiency will be much less valuable than those that depend on spell-casting.

Message-ID: <64596@bbn.BBN.COM>
Source record: 113831

Well, my worst nightmare finally happened - it looks like a power line surge from a passing storm took out my whole system. Actually two - the first one, two weeks ago, took out my 65XE. I bought a 800XL off a coworker, and now that one is gone too. Roughly the same symptoms. Now, the XF551 is totally dead, the 1050 is flakey, and it looks like the XEP80 is having problems too. (I have a 400 I used to appraise the damage.)

This is the first time I have had something break. So I am asking what is the best thing people have found to do - call Atari, local repair shops, etc.

Note: I am tempted to upgrade to 32-bits. It will depend upon the cost to repair/replace, and the value I place on the 50,000 tons of software I have collected, not to mention some good Infocom text advs I haven't even booted yet.

I just got a copy of the _old_ game Blue Max from someone,
but there are no instructions, I can figure it out for the most
part, but there are somethings which I cannot figure out.

-How do you land on the runways? Sometimes it gives you just an R
at the bottom, but you cannot land, and some times there is
an L and you can. The last couple of games, I ran out of
fuel waiting for a runway I could land at.

-What do all of the damage codes mean? I figured out G for guns and
B for bombs, but after that I am stuck.

Thanks

It's been quite a few years, but as I recall, you need to get fairly close
to the runway, reduce your altitude to below 100 (?), *press the fire button
once to lower the landing gear* then move your plane down to land. You
should glide to a stop.

>-What do all of the damage codes mean? I figured out G for guns and
> B for bombs, but after that I am stuck.

I think there was "F" for fuel (if damaged your fuel went down much more
quickly), and "M" for maneuverability (if damaged, your plane moved much more
sluggishly).

>Thanks

Hope this helps.

You happen to be in a great part of the US for getting your ataris fixed,
and running in no time.
THeres locally (computer zone in North attleboro), Syntronics in kenmore
square.. and better yet, theres a local board for 8 bitters where the sysop
knows the ataris inside and out and does good work for a reasonable price.
THe board is on the North Shore of Boston towards Lynn way..
If you want the # send me privately.
He fixed 5 drives for me, installed a rambo for me, and did it all well and
cheap too!
Call em.

I have an 800, an 800xl, and a 1200xl and while I think the 800 had a nice
keyboard to it, the "feel" and lighness of the 1200xl'S board is
awesome. Nice and springy.. I miss it now that I use an 800xl.
I needed to switch because i got an MIO.
(also put in Rambo!).
I think theres an even better keyboard than the 1200xl.
I read somewhere about putting an IBM keyboard on an atari...
THat would be great.. (probably cost an arm..).

From: gknauss@sdcc13.ucsd.edu
Message-ID: <20525@sdcc6.ucsd.edu>
Source record: 113844

>I saw a disk recently of Blue Max 2001.. I dont know if its the same game as
>the original thogh.. ANyone know?

It's, technically, not the same. It has new graphics and a few new
features -- but nothing spectacular. I liked the original better.
"2001" has the trying-to-cash-in-on-a-popular-name feel to it.

4142. Help!

Newsgroup: comp.sys.atari.8bit
Date: 1991-06-12 21:10:56 UTC
From: mark@umbra.gatech.edu
Message-ID: <1530@mephisto.gatech.edu>
Source record: 113843

I'm posting this for a friend of mine. Please don't e-mail replies to me; use his address: ce133ei@prism.gatech.edu. It's repeated below.

Somebody out there, please hear this and help me out.

I have an Atari 800XL with 256K, Spartados X, an XEP80, P:R: Connection, SX212 1050 drive w/US Doubler, AND NO SOFTWARE THAT WILL LET ME USE ALL OF THEM AT THE SAME TIME!

All I want is a terminal program that runs under Spartados X, lets me use the XEP80, and has an RS232 driver for the P:R:C (that is ALSO compatible with SPartados X AND the XEP80).

So far, every one of the terminal programs I have stubbornly refuse to work with at least one of the above-mentioned devices.

850 Express 3.0 doesn't seem to like the XEP80, regardless of what i've been told.
Bobterm totally ignores the XEP80 also.
I've also tried amodem 7.4/7.5, omnicom(total lockup no matter what), vterm (this program seems to do EVERYTHING except talk to the modem. It hates 80 cols too.) Backtalk (dumped back to the command prompt)

So far, the most success i've had is by usin the sx212 in direct-connect mode, and using Sparts 3.2 with Mark Gamber's term80 (uses a graphics 8 version of an 80-col screen) so I can see 80 cols (just barely) but am missing quite a lot of nice functions i'd prefer to have.

If there's ANYONE out there who can tell me how to get hold of a teminal package that can use all of my equipment, PLEASE email me at ce133ei@prism.gatech.edu.
I would be deeply in your debt. Oh, o ne thing: PLEASE don't assume that I necessarily have the appropriate handlers. Usually it seems that I don't. Please assume that I have NO software. I'd rather have two of something than none of it.

Sorry about the overall tone of this message, but I'm really worn out with all of this.

P.S. Macros, VT100 support, etc., would be GREAT, but aren't necessary. I'll beg for that later.

Final Announcement

The Department of Architecture at the University of California
is putting together a catalog of software used by architects.
The book will include all software used in the profession,
including CAD, project management, modeling, rendering,
facility management, etc.

To be included in this reference guide, firms and individuals
must fill out a two page questionaire available by mailing a
request to:

Douglas Noble, AIA, Ph.D.
Department of Architecture
232 Wurster Hall
University of California
Berkeley, CA 94720

Bobterm will work with the XEP80, but you need the file called XEP80.BTM.
It should be on your original disk, or in BOBTERM.ARC. You rename XEP80.BTM
to MODULE1.BTM. (Or maybe MODULE2.BTM if you're using the Sparta command-line
module.)

Depends on how much an arm & a leg are worth :-) The TransKey board,
which is the interface between the IBM keyboard and the 8-bit Atari,
costs under $50 (in fact it's on sale now). It's available from
DataQue (maker of the Turbo-816 board and other stuff for the 8-bit
Atari - if you want the address & tel. #, send me mail and I'll look
it up at home. DataQue acquired TransKey from Micro Solutions, and
has posted notices on the online services, etc.). IBM keyboards can be
had for cheap (I've seen somewhere, an article saying that they can be
found for as little as $25, but I don't know for sure), so maybe you
could swing it.

I wonder, though, how many existing Zmodem implementations will actually
support this. I know that 8th-bit quoting and other features for
non-transparent networks are often left out of PC Zmodem packages.

But there's an 8th slot (sort-of), which is even _more_ interesting. It's the long card-edge connector on the very back of the 800 motherboard, behind the CPU card. It's normally covered up by the shielding, completely inaccessable unless you remove the shielding or cut a slot through it. The connector carries just about the entire bus, and was used for factory testing. As far as I know, nobody ever developed a device that would hang off it and do something practical. Some large RAM expansion cards required jumpers run to it, though.

>who have SIO modems and drives, it's pretty much impossible.

Actually, the Zmodem protocol had that possible limitation in mind and supports systems that do not have modem/disk overlap capability. The zmodem protocol specifications specifically mention that zmodem will work under this limitation.

>Someone might write it, but it would be wierd. Zmodem is a lot more complex to
>implement than, say, Ymodem, it gives only slightly better performance, and it
>would only work on a very small subset of Atari 8bit systems. Who'd bother?

Yes, it is much more complex than other protocols, but a subset could be implemented that would give enough flexibility to satisfy hobbyists. In my case, performance is not the overriding factor, but rather the fact that Zmodem does not require complete transparency over the transmission network. This comes into play when transferring over Internet. Kermit suffices, but it unbelieveably inefficient.

As for who would bother, I'm not really sure :) I _might_ bother, but I don't know if I will. Bob Puff told me it was on his to do list for BobTerm, but that he does not have the time to work on it now.

4152. ATR8000 & ST controls 8bit

Newsgroup: comp.sys.atari.8bit
Date: 1991-06-16 01:53:44 UTC
From: AAron@sun.soe.clarkson.edu
Message-ID: <9106160153.AA00321@sun.soe.clarkson.edu>
Source record: 113856

I am basically looking for 8bit Atari people. And I have two questions.

1) Does anyone know what the cable looks like that you use to hook up
your ATR8000 to an RS232 terminal instead of an Atari, for CPM?
I believe it hooks into the SIO port of the ATR8000, but I cannot
figure out which pins are needed... I have experimented, after changing
the jumpers J7 and J10, but had no luck.

2) I want to control my 8bit from my ST. My idea is to have the machine
look to the R: instead of looking at E:, for input and output. I have
played with this idea and even got my R: handler to replace the E:
vector in the HATABS ($31A-$33F) upon booting, but then I get a never
ending flow of ERROR 133 (Device or File not Open)...
I thought that was the way to do it...

I want to use MiNT and MGR and have my ST to use and another MGR window
devoted to another machine!

I'd really appreciate ANY help on these!

-AAron

4153. In search of "MindLink"

Newsgroup: comp.sys.atari.8bit
Date: 1991-06-17 17:29:45 UTC

> on the screen, and it goes there (eventually). It takes
> practice...'

Presumably this is just a piece of hardware that monitors alpha-waves and you have to train to use it via biofeedback. Does anyone out there know if this product ever really made it to market? Does anyone out there *HAVE* one of these (that they'd be willing to sell)?

Conceivably, it could be much more mundane; the band could simply monitor tension on the forehead muscles rather than detecting alpha waves. I believe the product "Relax!" by Synapse many, many years ago used a head band that monitored tension as a biofeedback device, with which you could "control" a kaleidoscope display. I never saw the device myself, I just read about it.

Well, I can vouch that such devices used to exist. I remember playing
with one on my old Atari 800 (8-bit). I cannot remember the name of
the software, but it included a "band" type sensor. The program had
three parts. One was a sophisticated biofeedback monitor, one was
a really neat graphic/sound demo which was supposed to help you "relax",
and finally there was a (very mellow) game. The game had you guide a
balloon up through the sky, avoiding mean old clouds and stuff. As a
controller, the thing basically emulated a paddle (ie left and right).
To get the 9 signals needed for a joystick would take some doing?!?!

From: njd@cbnewsd.att.com
Message-ID: <1991Jun18.231055.4825@cbnewsd.att.com>
Source record: 113865

I rec'd e-mail from someone saying that he was interested in using an IBM keyboard on his 8-bit, and to please send him the address of DataQue. Due to line noise, I accidentally deleted his mail - so I don't have his e-mail address. Since this is probably of general interest, I decided to post it.

Quick recap: the TransKey IBM-keyboard-to-Atari-8bit adapter is available from DataQue.

Even though the sale is supposed to be over, according to the "Official ... Sale Details" article I downloaded, the solder-in version, needed for XEs and other un-socketed 8-bits, is still under $50 [$47]; the plug-in version is a bit more [$57].)

DataQue Software GEnie: DataQue.1 BBS: (419) 529-5197
P.O. Box 134 Delphi: DATAQUE
Ontario, OH 44862 CIS: 71777,3223
USA

I have no personal experience with or knowledge of TransKey. (However, I do know that Chuck Steinman of DataQue is a widely-respected developer of 8-bit software and hardware.)

4162. Still more stuff for sale...

Newsgroup: comp.sys.atari.8bit
Date: 1991-06-19 00:06:44 UTC
From: Ordania-DM@cup.portal.com
Message-ID: <43444@cup.portal.com>
Source record: 113866

Yep, here it is again...

Listed below is everything that I am selling, with prices. Anything with
a number in parenthesis after it means I have that number of those items.
If you don't like my prices, feel free to make an offer, the worst I'll do
is politely turn you down. The items listed together for one price are
meant to be sold as a group, if noone makes a reasonable offer on them,
I'll consider breaking them apart. THE PRICES DO NOT INCLUDE SHIPPING.
(Alot of this stuff is heavy, and shipping is too variable a cost.)
If two or more persons want the same item, I'll sell it to the person
who buys the most stuff.
If you have any questions about the items, feel free to ask.

Computers:
$75 800xl - hacker: RAM OS Switch, D6 & D7 pages usable as ram
External keyboard attached (NOT the upgrade)
$40 800xl - broken keyboard
$40 Atari 130xe - broken, with 4 keyboards (all broken)
$25 Atari 800, w/48k
$15 Atari 400, w/16k
$15each 1200XL mother board (4 available)

Disk Drives:
$150 XF551 DDDS Disk Drive, Upgrade rom for 3.5" disk drive installed.
$125 Indus GT DDSS Disk Drive, with write-protect switch (ask)
$85 1050 Standard Disk Drive

Peripherals, High End:
$200 Magnavox RGB Display 80, XEP80 80-column/Printer Interface,
video cables, & switch box (to switch between 40/80 column modes)

Peripherals, Low End:
$20 Atari 1030 modem
$25 Atari direct connect Seikosha printer (slow, but it works)
$10 Alien Voicebox (doesn't work, don't know why)
$5 Standard 410
$2 Standard 410 - missing cassette cover
$4 Atari 1010 - pause button broken off, no power supply
$6 Atari 1010 - no power supply

Connectors:
$15 CX85 Keypad
$10 Trackballs (2)
$5 Paddles (4)
$2 Keypads (3, from 2600 Star Raiders Game)
$1 Joysticks, broken (lots)

That's the end of the hardware, now for the list of software:

Cartridge languages:
$35 SpartaDOS X - latest revision
$35 RTime-8 - with battery socket
$25 Basic XL
$15 Action - no docs
$15 Atari Assembler
$10 Mac 65 ToolKit
$5 Atari Basic

Cartridge games:
$10 Adventure Creator
$5 each - Super Breakout, Star Raiders, Digdug, Jungle Hunt, Gridrunner,
Miner 2049er, Robotron, Serpentine, Star Trek, Computer Chess,
Jumpman Jr., Jumbo Jet Pilot, Submarine Commander

Miscellaneous Cartridges:
$5 Atari Artist
$5 Education System Master Cartridge
$5 Pill cartridge (may not work)

Disk Software:
$10 Visicalc
$10 SmartDOS
$10 Adventure Writer
$10 Ultima II (missing map)
$10 Ghost Busters
$10 Mail Order Monsters
$10 Seven Cities of Gold
$10 Spy Versus Spy, Volumes I & II
$5 Antic MAPWARE
$5 Superman
$5 Antic RAMbrandt
$5 Murder on the Zinderneuf
$5 The Wizard and the Princess (hi-res adventure #2)
$5 Lepus Revenge
$5 Home Financial Management
$5 Filemanager 800+
$5 Atari Word Processor disks
$1 Atari DOS 3 (2)
$3 Antic DISK, July 1983
$3 Antic DISK, November 1980
$3 Antic DISK, Feb/Mar 1990
$3 Analog DISK, July 1988

Also available are blank disks ($0.15 each), and PD disks ($0.50 each).
And, of course, diskette holders - 4 50 disk holders, $5 each.

Tape Software:
$5 Tanktics

Literature/Documentation:
$7 Compute's Second Book of Atari
$5 Programmers Reference Guide for the Atari 400/800 Computers
$10 Machine Language for Beginners (2)
$10 The second book of Machine Language
$10 The Atari Basic Source Book
$10 Inside Atari DOS
$5 Atari Roots (guide to machine language)
$5 The Atari Assembler
$10 6502 Applications - Rodney Zaks
$15 6502 Assembly Language Programming - Lance Leventhal
$19 6502 Assembly Language Subroutines - Lance Leventhal
$10 Top Down Assembly Language Programming for the 6502 - Ken Skier
$5 Inside Atari Basic
$5 Basic Exercises for the Atari
$5 Atari Programming with 55 programs
$5 Forth on the Atari
$5 Program Descriptions 1 (for Hofacker software on your atari computer)

Well, that's all of it, almost... I have have a ton of paperwork (magazines, copied articles, etc), a bunch of junk that I didn't bother listing, and about 100 disks filled with PD stuff. If you don't see something you want, just ask, I might actually have it. Also, if you buy a lot, I'm willing to give you a discount (the size of the discount depends on how much you buy :).

Anyway, if you are interested in any of this, here is my address & phone:

4163. Hard drive for 800XL?

Newsgroup: comp.sys.atari.8bit
Date: 1991-06-20 03:38:44 UTC
From: md432151@longs.LANCE.ColoState.Edu
Message-ID: <15579@ccncsu.ColoState.EDU>
Source record: 113867

I was wondering if there exsists a hard drive (10 Meg or so) that can
be attached either to the serial port or, preferably, the parallel port.

Also, while on the subject of parallel ports, does anyone know where I
may find the pin-out of the parallel port on the 800XL?

Any info would be greatly appreciated.

Thanks.

Mike Donahue

> your ATR8000 to an RS232 terminal instead of an Atari, for CPM?
> I believe it hooks into the SIO port of the ATR8000, but I cannot
> figure out which pins are needed... I have experimented, after changing
> the jumpers J7 and J10, but had no luck.

SWP sold a proprietary SIO<->DB25 cable that I refused to pay for. I
mounted a DB25 female jack on the back of my ATR and put a 3P2T switch on
the front. The salient SIO pins are 3 (Data in), 5 (Data out), and 6 (Ground).
I wired these to their analogous RS-232 pins on the DB25 (2, 3, & 7), and
wired the switch to J7 and J10. Now all I have to do is flip the switch
to select Atari or CP/M mode.

All in all, the ATR-8000 was a nice piece of work for its day (and for its
purpose). Mine still sees some use...

I have yet to see a parallel or serial hard drive (which could conceivably attach to *any* machine, provided that a driver exisited for that machine). However, the machine that I use at home has a parallel 3.5 floppy drive, and it is soooo slow that it is unbearable to use for anything other than to move rarly used programs on to for storage purposes. Of course, a serial drive would be even slower.

Normally, hard drives connect to the machine directly through the hardware bus which ties in directly to the processor. There are several devices for the 8-bit which connect to the hardware bus (which is what you see on the back of the 800XL if you remove the small plastic panel) which act, among other things, as a hard drive controller. The Black Box is one, and the MIO (which is one of the things that ICD is blowing out for 50% off). I have little knowledge of the Black Box, but I know that the MIO also gives you two serial ports, a parallel port, either 256K or 1Meg upgrades (partitioned as RAM drives), plus it has an internal expansion slot which was intended to be used to hold a never released 80 Column card. Evidently, the MIO's power supply was mounted next to this area, and generated too much heat, and caused too many problems with the interface card.

>Also, while on the subject of parallel ports, does anyone know where I
>may find the pin-out of the parallel port on the 800XL?

Again, the port on the rear of the 800XL is not a parallel port, but rather the hardware bus.

>Please e-mail responses to md432151@longs.lance.colostate.edu

I posted this to the net because I think things of this nature are of general interest, and besides, their isn't too much traffic in here to discurage discussions of any sort.

4166. Reviving the 8 bits

Newsgroup: comp.sys.atari.8bit
Date: 1991-06-21 21:09:50 UTC
From: tnfw0@isuvax.iastate.edu
Message-ID: <1991Jun21.210950.3112@news.iastate.edu>
Source record: 113870

Just to try to start a discussion...

How can the 8 bits be revived, since it appears that they are pretty much dead?
(Ie, almost no commercial support, a fairly small number of users, etc.)
And are they worth reviving?

I still use mine, and probably will after I get a new computer soon, but it's
kind of depressing sometimes to use a computer that generates as little
excitement at these ones do...

Steven Ourada

I'm just curious as to how much YOU think these items are worth...
Please e-mail me and let me know how much you'd pay for any of
the following:

Atari 130XE
Atari 1050 disk drive
Atari SX212 modem (1200 baud)

Okidata Okimate 10 (color printer) w/ Commodore or Atari interface

Commodore 128 (w/ RS232 interface)
C= 1571 drive

Magnavox RGB display 80

Sony XR5000 car stereo (tape/AM/FM) Sweet stereo!
Sherwood Graphic Equalizer Xq-1101
(with digital bands, surround sound, programmable,
7 bands)
Coustic 120 watt Amp
Jensen 300 watt Amp

Thanks,

Source record: 113873

I'm curious how the 8bit emulator for the Atari St/Mega
systems works... like, how can you get the programs from
the 8bit to the ST/Mega to begin with?
Do you need a 5 1/4" Disk drive for the ST/Mega?
Please, e-mail me and let me know!
I'm considering buying a Mega4, and then transfering my progams
from my 130xe to the Mega..

I also have heard that a C=64 emulator is out for the ST/Mega.

Does anyone out there have experience with this?

Thanks,
Marc Bluefire

Well, this one's worth $2000 off the price of an Amiga 3000, if you've got the cover off of the original manual you don't even have to trade it in, just write down the serial number and give the manual cover in to the shop.

I think that the 8 bits cannot be revived. For one thing everything out
is now a 16bit mega system.. Its all ST, Mac, IBM and Amiga.
In the coming years, those will be obsolete as newer technology
keeps evolving. Atari was and is a good machine for its time, but
that time is ending. If you can still enjoy it and get some use out of it
thats great! I have 4 of them and I am not even considering an upgrade.
Im getting my hard drive setup on this and im still expanding over here.
While theres no commerical support, there are a lot of things out
that can make the 8 bit every bit as good as the Ibms and Macs..

Im not a stereo or Commordore expert. SO i wont comment on those.
I would say that you should really have said if you were talking
USED or new stuff..
Ill go for used.
130xe's have been known to sell locally for around $50.
Sometimes they go for $65.. Depending on its condition.
The keyboards on the machine arent too great and sometimes theres
money off due to dead keys..
1050's tend to go for all sorts of prices.
I got some damaged ones for $15, $10, and $10..
A working one should get between $50-75 again..
Depends again on the condition what I offer on those.
Im usually after defective ones as I can usually rip apart another
defective model and make a workable unit.
/e

Now, an sx212 should net $35-45 dollars used. The same price as any used 1200 baud modem..

Okimate 10's arent well liked locally, Its not a well made product according to many. I think that its a hassle to obtain the plug n' print ribbons around here.. I see them giving them away for $20.. In other areas maybe you woud get more.. I think its supposed to be a slow gadget that isnt well made, that is tough to get replaced. Not sure if they still service them either.

Im sure other people here from different parts of the US will give you differing prices so this was just an opinion of what I would expect to pay..

Just a small note here... A friend of mine told me he saw an ad for a 1200bps modem in some discount place's catalog (sorry, don't remember the name...) for $30. It wasn't advertised that it was an Atari (or that it would connect to the 8 bits), but a close look at the picture revealed that it was an SX212...

I think that the 8 bits can be brought back to a point of viability but not much more. Nintendo showed that their can still be a workable 8 bit market.

But, you know technology is on your back when dedicated game machines are 16 bit.

I dont own an ST yet, And dont know if I ever will now that Ive been saddled with an IBM compat and the IBM compat market is really just starting to exploit the capability of these marvelous 16\32 bit machines.

I worshiped by 8bit Atari and would trade my 386 in an instant for the days of Ataris. I hope Atari gets their marketing together and storms the home market again.

Just FYI (I thought this was curious anyway...)

In the most recent DAMARK catalog, on the back page, I saw advertised:

"HAYES - COMPATIBLE 1200 BAUD MODEM -- Mfr. Sugg. Retail $59.95
Model $: SC212 Damark Price $29.95"

Of course it was the SX212, not SC212. I thought that it was an
interesting thing to see in a catalog of this type. Most of the computer
hardware was old 80C88 laptops, and XT's, and a few 286's and 386's

Hi Michael,
Just to add to what Daniel has already mentioned. Unless you
are willing to spend $300 to $500 (possibly!) adding a hard drive to your
8-bit system, there is a less expensive option.
You could a 720k 3.5" floppy drive to your 8-bit for much less money.
Granted it is not as fast or as much storage as a hard drive, it does on the
other hand cost alot less than a hard drive!
You can build your own 8-bit 3.5" floppy drive by aquiring an Atari
XF551 drive, then modifying it with Bob Wolley's XF35 kit (available from CSS
I believe). Hopefully someone has the addresses and phone numbers for either
Bob Wolley or CSS (Bob Puff's company). Bye.....

Luis

I got all excited when I read this too, called them, and found out that the MIOs are the only thing that is not marked down. At $100 I'd think about it, but $199 is too much to pay for 256KB at today's memory prices.

You know, when people talk about support for the 8-bits or reviving them or making them exciting again, I always wonder what the fuss is about. Sure, their time has passed and no new software is being released. But it is also true that now you can get thousands and thousands of programs and usually at discount prices these days. I personally have more programs for my 8-bit than I could ever hope to use fully in my lifetime.

So, really, I could care less if I was the last Atari 8-bit user on the planet as long as I still get good use out of it. And I do. So either you find it exciting and use it or you don't. I don't feel the need to justify my owning and using an Atari 8-bit to anyone, most especially myself.

Does anyone know why Kermit with the xep80 will not let me
delete when I get past 40 characters on my screen?
What should my screen attributes be set to for use with the xep80? and
am I doing this right if I load in my XEP80 bootdisk prior to loading in
kermit???

Also, has anyone written a TERMInal emulation for 8 bit that is powerful
enough to run emacs? (ala vt102?)

I know of a few life games for the 8 bits, there's the stupid little one from Analog (Fastlife?), some PD basic/ml one (using 160*96 graphics, pretty nice), and then, there's the one I saw advertised in Antic's catalog. This one sounded really nice from the description, with a cut and paste editor, storage of past generations, etc. (if I remember the desc. right). Now what I want to know is, does anyone know of any other ones, which one is the best, etc... And does anyone have the Antic one? I think it was PD, if so, could it be uploaded to atari.archive or something? :)

Thanks,

Unfortunatly, the Damark Catalogue is currently in the Sacramento County Dump. The next time I receive one, I will try to remember to post their address/phone number. In the mean time, in order to receive a Damark catalog, I suggest that you order lots of products via mail order. Sooner or later you are bound to end up on their eternal mailing list.

I do have quite a few public domain games for the 8-bit that I would be
willing to send either to the net, or to you via e-mail. I suspect that
most of them have appeared here at one time or another.

Speaking of which, I wonder if someone here would be so kind as to post the
location of the archive-site for 8-bit files?

Are you talking about Kermit-65? I assume you are.

As I've pointed out a couple times now, Kermit-65 has never been really debugged to work properly on the XEP80. It runs, as you've discovered, but it has some weird behavior, especially when the cursor is on the right half of the screen. If you think Delete acts funny, try doing full-screen editing! Not good.

This all has to do with the fact that to run K-65 on the XEP80 you tell it Set Screen Atari, which means "Just use the Antic gr.0 display, no scrolling windows, no 80 columns in gr.8. The author finally taught the "Atari" screen to not print cr's every line, but every other line, so it comes out right on the XEP80. But that's all he did. Other VT100 types of things still don't come out right. What's really neat is when the host sends a Clear Screen command, and K-65 only clears the left half of the screen!

I am right now trying to obtain the program called VT850 that is supposed to do VT100 on the XEP80 nicely. Meanwhile, maybe now that there's not one but two of us that want Kermit-65 fixed for the XEP80, someone will magically appear out of NetLand to save the day.

I've used Kermit-65 many times and think it's a great program. It's certainly the most robust/reliable 80-column terminal program I've seen on the Atari to date.

I'd like to know who the author is. Maybe he'd like to put the source code into public domain, since he seems set on not updating the program any further (I believe the last version is 3.7).

Interesting, although the documentation is good, he does not give his own name or any means by which to reach him.

Does anyone know how to reach the mysterious author of Kermit-65?? If you do, please MAIL me this information, as the Unix box I read the net news on doesn't keep info for very long and I tend to miss a lot of messages.

> Steven Ourada

I don't think the Atari 8-bits are worth reviving in the marketplace, since I don't believe it would be possible to get it up to the status of the C-64 as far as software. The reason I compare it to the C-64 is not because of any preference of mine. I have liked and used my Atari 8-bit for four years now. I compare it to the C-64 because it is, to my knowledge, the ONLY 8-bit personal computer that is still being sold in mass quantities, miraculously as it is. And new software is still being made for it. The amazing thing about the C-64 is that it has outlasted even the "Apple II Forever" Apple II+/e series. I believe the only Apple II that Apple has been making for the past couple years is the IIGS. And unlike Apple's usual character of supporting its computers and encouraging 3rd-party support, the Apple IIGS has gotten little support. From what I've heard from others, the discontinuation of most of the Apple II models and the lack of support for the IIGS seems to have been caused by Apple's own decision making, not because of the market. I've seen some of the stuff the IIGS can do, and it almost ranks up there with the ST and Amiga, even though its 8/16-bit 65816 CPU only runs at about 2.8 Mhz. It's a sad story reminiscent of the history of the Atari 8-bit.

I think the Atari 8-bits might still have a use in certain niche areas. I remember reading an article in Antic, back when it was still being published as a stand-alone magazine, about a company that sold teleprompter equipment to show studios. All the equipment was in a box, so all that was coming out of it was a joystick, a disk drive slot, and a keyboard. Little did the people know, who were buying it, that there was an Atari 8-bit computer inside the box. the author said the reason they picked the Atari is that it was inexpensive and it was relatively easy to make it do overscan and smooth-scrolling.

I have heard some BBS sysops (who run Atari 8-bit boards) say that some of their users are amazed when they tell the users that the BBS they've been using is an Atari 8-bit hooked up to a Multi-I/O with 60 Megs on disk. I have been on a few of the Atari 8-bit boards and they are just

FULL of features and games. As a matter of fact when I used to compare them with MS-DOS BBSes I was on, I actually considered the MS-DOS BBS software to be sub-standard compared to the 8-bit BBS software. I don't think the same can be said today, but it's taken a while for MS-DOS BBS software to match the capabilities of the Atari 8-bit BBSes. In addition, the Atari sysops said they would consider the Atari 8-bits, with the appropriate extra hardware, to be excellent BBS computers, since they are cheap, have lots of features in the BBS software, are pretty fast relative to BBSes on other computers, and you can use it to run your BBS the whole time, while you use your more powerful computer (whatever it may be) to do other things.

The reason I talk about niche markets is it's some of what Atari seems to have been encouraging with the ST. Some companies have bought, customized, and then resold ST computers for specific markets and purposes, such as desktop publishing.

I think Atari 8-bit computers could still be useful to people who don't already have one, by selling them to people in niche markets, granted that the appropriate extra hardware and software is sold along with the the computer to make it useful for that niche.

I have just about pushed my Atari 8-bit to its limits. I am looking forward to getting an STe someday. My Atari 8-bit has done well for me through three years of college, and I haven't had a single problem with it for the four years that I've had it. The one thing that's broken down twice is my 1050 drive. So far it has met my needs with word processing (Atari Writer Plus) even for large papers, entertainment (obviously), telecommunications with several term programs (BobTerm for BBSes, Chameleon for 80-column 2400 bps. VT-52/ADM-3A terminal emulation and file transfers on Unix systems, and VT-10 Squared, a PD 80-column VT-100 emulator with all 80 columns on the screen at once), and languages (Atari BASIC, and the CC8 PD C compiler). The CC8 compiler is really what added more life to my 8-bit, because now I can write programs in C and compile them into stand-alone binary programs. I really like the C language, so this has encouraged me to do more programming on my 8-bit. I would have to say that nowadays the most used software on my 8-bit is terminal software (that could be another use for it: A cheap terminal capable of a few terminal emulations), since I like communicating to other people on BBSes and stuff with it.

Niche markets are definitely a good place for the 8bits. I'm pretty sure that no other computer with a decent amount of power is available for the prices that Atari 8bits go for now. Certain educational uses could be envisioned, if, of course, the Apple][didn't have such a strong hold in that area.

A local BBS in my area runs on a hugely expanded 130XE system (4 meg of RAM, 60 meg of disk space, 4 floppies, etc.). The sysop is constantly adding to his system and improving his BBS software, to the point that his system is one of the fastest in the area. Not to mention that he put it all together for $1500 or less plus labor.

On that last note, I think an 8bit with some slightly souped up software could run a fairly complete battery of terminal emulations, and with the software on cartridge and a low res mono monitor, the package could be sold for <$350. I don't know what terminals sell for normally, but I'm sure that would be competitive.

Wondering how you read news on an 8bit Atari... all we have here is vnews and rn and my friend doesn't have proper emulation for either of those... What's the best bet? Get a new terminal [he's using BobTerm]???

while i'm at it, i might as well add at least $0.015 worth... I started out when I was... ummm.... eleven or so... 1982 or 83 i think... with a used 1200xl and a 1010 tape... [well, actually i started a few years before on one of those Timex Z80 machines but...]

Now that I have my "super stomper" 386 with 105MB HD and 2MB RAM [4 on the way, of course).... allllllll I do is COMPLAIN about the thing! I would GLADLY trade it all back in to have the 'glory days' of Atari 8 bits back... They are truly wonderful machines.... the price/performance ratio just can't be matched.... and everyone that own s one almost universally agrees that they are great... ugh. now i am making myself feel like a traitor for abandoning them! [I have my reasons though.... it's hard to take an 80x86 assembly class running a 6502!]

But all and all, this machine has caused me more headaches in eight months than my ataris did in eight years [although the 1050 drive was quite of another story--- i frequently had to revert to the 1010!]

enough i guess... so, any suggestions for my friend would be VERY much appreciated!

thanks...

4197. Specific Questions for the 130xe

Newsgroup: comp.sys.atari.8bit
Date: 1991-07-01 22:47:22 UTC
From: jbuhl@daimi.aau.dk
Message-ID: <1991Jul1.224722.10341@daimi.aau.dk>
Source record: 113902

Hi, there.

In my efforts to create a multiprogram-compiler for the Atari 130xe (yes, I know: I have too much time, right ?), I've ran into two problems:

First, I need to use all 128k of the computer. The only Manual (a German, would you believe it?) I've got, says that this is done using address 54017, but not how (it tells how to switch between the 5 memorybanks). Would someone supply me with a little machinecode-routine doing the job (ie. copying the ROM to RAM, and then switching the ROM to Neverland) ? Please held it as simple as possible, since I'm using my own home-brew assembler, which I guess doesn't support all these fancy features of your favorite assembler.

Second, I need to know (EXACTLY, preferably) which addresses, routines and interrupts are used to read/write sectors, read the status, format, etc. a double-density disk in a 1050 drive (typically I need to do exactly the things, supported by the standard SIO-call) in order to make the routines as small and compact as possible (the system I intend to make is an operatingsystem capable of running 8 processes, together with a ConcurrentC-like compiler supporting these facilities, and a graphics display with 80 chars/line, so space is not what's leftover in huge measures).
So before I try to figure it out in detail, I would like to hear from people who knows - more or less precisely - what's necessary to control the diskdrive, and what is actually superfluos (<- I hope thats the right word).

Many thanks in advance,

The ancient early Video Easel cart had a simple LIFE implementation within it. Nothing like you'd find from just a few years later, but it's there! (I remember drawing my NAME in block letters and letting it run til it stabilized; it took over 4000 generations. whoa!)

The mysterious author of Kermit65, in the Atari 8-bit context anyway, isn't entirely an Author so much as a Porter, and his name is John Dunning and he USED to read this newsgroup and I'm real surprised he hasn't responded to this discussion yet. John, are you out there?

Anyway, as of this time LAST year, John worked for Symbolics in Eastern Massachusetts, partway between the Mass Pike and the lovely (cough) town of Lynn. :-) I drove right by his building while en route to visit someone else last July, but didn't find out til too late...

Any-hoo, John SENT ME the Kermit65 sources a long time ago, and in fact I was just looking at them the other day. Basically, the original code was for the C= 64 (Kermit_64_), and John took out the hardware-specific VIC-chip stuff, and the C= 64 "kernel"-specific stuff, and replaced it with Atari equivalents (graphics modes, CIO calls, etc. etc.) and added ATASCII/ASCII mapping and a BUNCH of other stuff. As it happens I've seen C=64 source code for the original program, on one occasion, and it's interesting to compare. I won't pretend I COMPREHEND it, but it's still interesting. My hat's been off to John for a LONG time.

Now for the good part. I _might_ be persuaded to post the source, if enough interest is expressed; I'm also surprised it isn't available on Terminator -- has anybody LOOKED there? John is/was a mover-and-shaker of getting THAT thing started and keeping it stocked, way back when. I believe the source is intended to be cross-assembled by something that runs on the ST, since John included (to me, anyway) a C source program which "makes an a.out file into an 8-bit loadable binary"... The sources _I_ have are in UNIX-style ASCII (records delimited by ASCII 10 (LF) chars), not ATASCII, and although the files' extension is .M65 I see lots of syntax that Mac65 would probably not accept as-is.

Post here if you guys want Kermit65 source, and John Dunning you oughtta speak up if you're here! Hi guy!

Oh, okay.
The server is called atari@atari.archive.umich.edu.
If you send the server a message with just the word "help" in the body of the
message, it sends you complete instructions on how to use it.

BobTerm only does VT52 emulation. If vnews and rn require VT100 emulation,
then the choices of emulation software include OmniCom, vt10sqr, and Kermit-65.
I'm running K-65 as I type this.

Don't know about vnews, but our version of rn is just like most other unix progs.: once you select the correct terminal type for your hardware, it should work fine. My .profile just asks for my terminal type when I login, and I just respond "vt52" (for my Chamelon terminal emulator). Then, rn works fine.

Just my $0.02 worth.

4207. Re: News Reader?

Newsgroup: comp.sys.atari.8bit
Date: 1991-07-03 11:43:57 UTC
From: Chris_F_Chiesa@cup.portal.com
Message-ID: <43942@cup.portal.com>
Source record: 113911

In something of a coincidence, just as some of us were discussing Kermit65 source code, Todd Derr (tjdst7@unix.cis.pitt.edu) appeared, asking:

>Wondering how you read news on an 8bit Atari... all we have here is
>vnews and rn and my friend doesn't have proper emulation for either of
>those... What's the best bet? Get a new terminal [he's using
>BobTerm]???

I sent Todd some mail on the subject, but then it occurred to me that a POSTING might be of interest to readers whose interest in Kermit65 has thus far been slight due to just not knowing much ABOUT it. I therefore post THIS message, which is essentially the same as what I sent Todd, except, of course, for THIS paragraph and the opening sentence. I hope someone finds this information useful. Mail text follows...

If your friend wants to do this RIGHT NOW, he can/should obtain the Kermit65 program everyone's been talking about, here, the last few days. Besides having Kermit file-transfer capabilities, Kermit65 also does a mean (in my opinion the BEST available without additional hardware) VT100 emulation, in either 40 or 80 columns. I used Kermit65 exclusively for a couple of years until I started collecting other computers and wound up with "true" 80-column mode. Don't get me wrong, though -- I will NEVER give up my Atari 8-bit!

There are a couple of other programs that purport to do 80-column VT100 emulations on the Atari 8-bit: OmniCom, VT-ten-squared, and Chameleon, or some subset thereof. All have major shortcomings in the VT100 emulation area as far as I'm concerned; I recommend Kermit65.

Finally, even BobTerm may eventually be able to do VT100 (or, rather, generic ANSI) emulation. There's a guy on this Net working on that very thing even as we speak.

He CAN use Bobterm with rn, but this partly depends on the system he logs into. First, use the -l option for rn (among others, assuming the terminal is set for 'dumb'). Then use the 'stty' command to set the terminal for 40 cols., 22(?) lines (he may want to put this in .profile or .cshrc or whatever). The last part is the real kicker, since not all UNIX systems support this. If not, he may want to adjust rn's options appropriately so he can use ^S/^Q to go through an article.
Hope that helps.

a dumb terminal

Today I brought my Atari 800 (32K mem) out of retirement today. It has been 6 years since I last used Sparta DOS, and I would just like to say that it was one of the coolest machinces to work with. The good old days of 4 player M.U.L.E. and a quick game of Star Raiders (boy could they pack things into a 8k cart)!

Now I sit here, with my Sun workstation, wondering how I can hook it up to my Atari to bring my bbs out of its long sleep and allow remote access to it. Are there any 8-bit bbs that one can reach from the net? I yearn for the days when ATASCII cartoons were the thing to do.

ahh.....MEMO PAD....Density and a half drives...4 game ports...right carts...

4211. Kermit and uucp

Newsgroup: comp.sys.atari.8bit
Date: 1991-07-04 21:46:32 UTC
From: rempel@skorpio.Usask.CA
Message-ID: <1991Jul4.214632.13705@herald.usask.ca>
Source record: 113913

I've been using Bobterm in ASCII mode to get onto the local unix network and it works fine, except that I have to redefine the delete key so it works properly. My problem is that I want to download files from my directory on the unix to my 130XE. Bobterm is not good, since I'd have to use a simple ASCII dump and capture it as it comes down on my 130XE. This is not ideal for binary files. So I thought of uucp, which (correct me if I'm wrong) converts binary files to text files which can be more easily dumped and captured. Question: Is there any uucp encoder/decoder written for 8-bit Ataris?

The idea is that I will d/l stuff from the archive at umich.edu into my unix account, and from there d/l to my 8-bit.

I thought of using Kermit-65, but my understanding is that it also requires uucp. Can anybody verify this?

Thanks.

-Allan

I think you mean uuencode and uudecode, and yes, it exists for the Atari 8bits. There are Basic/ML versions which work fine, and a pure ML version called YAU and YAUE (the decoder and encoder). If nobody else does, I'll upload the basic version of the decoder.
Also, check to see if your system has the programs rz and sz. They are primarily zmodem transfer programs, but they can do Ymodem batch, Xmodem 1K, and Xmodem. Only problem is, it doesn't properly pad the last packet, so Bobterm won't get rid of the extra junk (this only happens with the last 3 protocols. Later versions of sz/rz may have corrected this). Most of the time this means nothing; just slightly larger files and some garbage if it was a text file.

No, it's not necessary for Kermit. If you want to dl a binary file using kermit, just set the file type or transfer mode to binary at both ends when you transfer. There is no problem with padding either. However, Kermit in general is slow and very inefficient.
For text files, you set the file type at your end to ascii (I think) if you want the file to be received as atascii, with the transfer mode at the remote end set for text.

Your welcome.

4214. 6502 detailed information

Newsgroup: comp.sys.atari.8bit
Date: 1991-07-07 00:35:49 UTC
From: buzzard@eng.umd.edu
Message-ID: <1991Jul07.003549.25402@eng.umd.edu>
Source record: 113918

I'm trying to write a 6502 emulator in C, and unfortunately
I can't find my old Rodney Zaks book on the 6502, so I can't
find out several things. I went to a decent local bookstore
but they didn't have any real technical information.

Here are the things I need to know:

o Which bit positions in P are the various flags?
(This is important in case you try to look at the
processor flag after it's been pushed; the Atari
OS does this to check the status of the I flag
during interrupt handling.)

o Which operations set which flags? I have a vague
memory of this, but I can't remember all the
variants. On the same subject, what is the bizarre
thing that BIT does?

o Does S point to the last byte pushed, or to the next
location to push? (This is imporpant if you use
TSX to read into the stack)

o On interrupts, does it push P and then the return
address, or the return address and then P? (I need
this mainly to make sure I get the popping order
right for RTI). For JSR and interrupts, does it
push low-byte then high-byte, or vice-versa?

o What exactly is the formula for calculating branch
distance for the relative branches again? PC after
the branch + offset - 128 maybe? Something like
that, I know.

o When using indexed addressing modes, does indexing
reach across to the next page? My best guess about
this is that indexed zero-paged addressing doesn't,
but indexed absolute does. For example, I'm assuming
these results:

```
LDX #$10
LDA $FF,X ; read from location $000F
LDA $1FF,X ; read from location $020F
```

where the middle instruction uses zero-paged X addressing.
[There may be no version of LDA that uses zero-page X
addressing, this is just to try to get the idea across.]
Either way is trivial to code in C, I just need to know
which version for each addressing mode. (Yeah, ditto for

indexed indirect and indirect indexed; what happens then?)

If you have any answers to these questions, if you want copies of answers to these questions, you have comments about 6502 emulation in C or you know of an existing program, or if you are interested in getting a copy of mine, *mail* me, buzzard@eng.umd.edu; the net doesn't need to hear it.

4215. Assistance needed with MULE and ARCH. II

Newsgroup: comp.sys.atari.8bit
Date: 1991-07-07 17:25:18 UTC
From: cs00bd@unccvax.uncc.edu
Message-ID: <3512@unccvax.uncc.edu>
Source record: 113919

I was wondering--does anyone out there know how to break the
copy protection on M.U.L.E. and Archon II?

(Put down that flamethrower!)

I OWN BOTH OF THEM---ORIGINALS, OK?

It's just that I love to play both of these on my ol' 800xl.
The original disks are getting pretty old and it would be a
shame to lose either of them to bit rot...

Any ideas on how to back them up.... (technical solutions ok. I don't
mind editing sectors)

Thanks,
Brian

Atari 8-bit computer and related stuff for sale.

Hardware:
Atari 1200XL - 64K computer
Indus GT - single sided, double density floppy drive
Atari 410 - program recorder (cassette)
Atari 850 - parallel/serial interface
Axiom AT-846 - parallel printer interface
Avatex 1200 - 1200 baud modem (does not work)
All power supplies
All cables relevent cables
All original manuals

Software:
Syncalc spreadsheet
Paint graphics program
Graphic Master graphics program
PrintShop - make cards, banners, posters, etc.
A few games
Various public domain software - graphics, music, games, etc.
Extra disks and cassettes

Literature:
Antic magazines:
Vol. 1 Issue 6
Vol. 2 Issues 1-12
Vol. 3 Issues 1, 3-12
Vol. 4 Issues 1, 2, 4-12
Vol. 5 Issues 1-12
Vol. 6 Issues 1-5, 7
Atari Explorer February, Summer 1985
The Atari User's Encyclopedia, 267 pages
The Book of Atari Software 1984, 429 pages
Atari Color Graphics: A Beginner's Workbook, 203 pages
The Best of Antic: An Anthology Vol. 1, 298 pages w/disk
The Elemtary Atari, 267 pages
Understanding Atari Graphics, 49 pages
24 Tested, Ready-to-Run Game Programs in BASIC, 252 pages

I haven't been around this scene for awhile so I don't kow what to ask for this stuff. Basically, I am at your mercy; make me an offer.

I would like to sell all of this in one batch, but I will consider offers for specific items.

Everything works except the modem. Books and magazines are in excellent
condition.

In article <1991Jul9.013615.27198@en.ecn.purdue.edu> n9ljx@en.ecn.purdue.edu (Scott A Stembaugh) was looking for a cartridge based terminal emulator because his disk drive died.

[Request deleted in the interest of conserving disk space.]

I just happen to have with me a copy of American Techna-Vision's catalog which offers for sale the (relatively) new Express! cartridge from Orion Micro Systems (Keith Ledbetter's company) for $67.95. It's a piggy-back cartridge like SpartaDOS-X or the R-Time 8. The advertising copy in the catalog states "The Express! cartridge will run without a disk drive or without DOS being loaded in the computer." As to whether it can emulate a VT compatible terminal or not, I don't know; it is, however, the only cart-based terminal software for Hayes compatible modems of which I am aware. Maybe someone else out there knows of another.

American Techna-Vision can be contacted at:

15338 Inverness St.
San Leandro, CA 94579
1-800-551-9995 (orders)
1-415-354-3787 (customer service)

Hope this helps.

Does anyone know where I can get a C compiler for the Atari? I think Antic used to sell a Deep Blue C. Is this still available? If anyone knows anything about this version of C or any other, how good is it? What kind of include files does it have? Probably the standard C i/o includes, but what kind of support for Atari-specific features does it have?

Lee

=>

C Compilers for Atari 8-bits

Deep Blue C -- First on the scene. A bit out of date now. Generates pseudo-code and interprets it.
Ace C -- DBC derived. Faster.
CC8 -- DBC derived. Faster than Ace C. Uses Ace C's linker.
Lightspeed C -- DBC derived. Commercial product. From most reports, not any better than CC8
CC65 -- Unrelated to DBC. Generates real relocatable 6502 assembly. Includes relocating assembler, linker, library, utilities. Probably roughly the same speed as CC8.

You can FTP Ace C, CC8, and CC65 from atari.archive.umich.edu:/atari/8bit
The compilers generally have some quirks and limits, so be sure to read the docs carefully to know what you are doing.

For what it's worth (I already e-mailed the guy who first asked) there have been cartridge-based dumb terminal emulators since the first time I ever laid eyes on an Atari 800 back in 1981 (and, by definition, BEFORE then :-)) ! To wit, the to me infamous "Telelink I" cartridge which was my first-ever experience with telecommunications (used with 300 baud acoustic modem, THOSE were the days!), and a "Telelink II" cartridge which came into my possession at a much later date and which I have never even inserted into the computer for a quick look-see...

I mention these because the original poster stated that VT-series terminal emulation (e.g.) was NOT important to him...

Anyone here ever use the not-too-widely-released-but-highly-revolutionary Plato cartridge? Plato was (not sure what form it still exists in) a very advanced graphically-based timesharing service based at the University of Illinois which had _great_ graphically-based interactive games, tons of educational software (kiddiegarten through college level), and technical discussion groups ala GEnie or Compuserve. Prior to the Atari cartridge a dedicated (expensive) Plato terminal was needed, since a touch-screen and 512x512 resolution was required. An IBM PC emulator was eventually written, but it didn't support the touch screen and thus couldn't be used for a substantial subset of the available on-line software.

Atari put Vincent Wu (?), the genius who crunched Donkey Kong into a 16K cartridge which made Colecovision's look bad, to work on a better Plato eumlator, and he came up with a cartridge which gave a scrolling window onto the 512x512 screen, or would rescale the screen to 320x192, and used the joystick to simulate the touch screen. Worked _really_ well, though the service was a bit slow since bit-mapped graphics were being sent over a 300 or 1200 baud line (this was 1982 or so).

At the time I worked as Atari computer buyer at a video/computer store, and the store's owner had pestered Atari enough to get a pre-release Plato cartridge (serial #000017 or something), one of only 50. We used this for several weeks, and were part of a very elite on-line Atari population consisting mostly of Atari R&D and other major developers. I remember dealing on-line with Gary Yost, then of Antic, now of Autodesk, frequently. There were some great on-line games on the system, including a Western where everyone had alternate (virtual) lives, you could marry other on-line players, get thrown in jail, etc., and things could happen to you while you weren't logged in!

I've still got the cartridge, which was eventually released with _very_ little fanfare, but I don't think Plato exists anymore.

For what it's worth...

=>
Nope, it is still around, but not as much. UDel used to be a major
Plato developer, but we scrapped out Cyber a year or two ago. Most of
the software was ported to the IBM PC using a language called Tencore,
but the rest was moved to NovaNet at Urbana, and we buy time on their
Plato system.
I haven't used the 8-bit Plato cartridge, but I understand that its
major limitation was that it would only work with a real, honest-to-
goodness 850 interface. Otherwise I probably would have gotten one while
we still had our Plato system.

Is the file cc65-src.arc in the Michigan archive what I think
it is? (ie: 6502 assembler source for a C compiler) I don't
own an atari, but instead a CBM64 where there's only 2
C compilers avalible (both commerical). Would it be feasible/
possible doing a conversion?

No, it is the C source for a 6502 C compiler. I imagine you could do a
conversion by changing the object file format and putting together your
own libraries. If you are on a Unix-type system, you might want to look
at the slightly modified Unix cross-compiler version that I have on
louie.udel.edu:/pub/cc65/cc65.tar.Z. You could probably bootstrap a C64
version from that.

4232. XEP80 R-Time tech info

Newsgroup: comp.sys.atari.8bit
Date: 1991-07-15 23:20:14 UTC
From: ahansfor@wpi.wpi.edu
Message-ID: <AHANSFOR.91Jul15182014@wpi.wpi.edu>
Source record: 113936

I recently dug out my 800XL in order to do some hardware projects.

I'm trying to put an 80 column card with clock on the PBI and would like these to be compatable with the Atari XEP80 and the ICD R-Time cart.

I would like to track down some technical information (hardware and software) on these products. If anyone has this information or a source I would be grateful if you would share.

Also, if anyone has a MAC/65 cart w/manuals and perhaps a Atari Assembly book, I'm currently in the market.

Does anyone know of a source on the PBI more extensive than the Antic articles?

Thanks for any help or suggestions you can provide.

4239. Thorny question...

Newsgroup: comp.sys.atari.8bit
Date: 1991-07-17 20:09:27 UTC
From: egoldberg@nssdca.gsfc.nasa.gov
Message-ID: <5911@dftsrv.gsfc.nasa.gov>
Source record: 113941

(In response to the comment of whether copying out-of-print software is piracy - I don't know how to quote messages yet!)

I have "pirated" numerous programs - stuff from 1979/1980, etc that simply can NOT be purchased regardless of how hard I try, and I am not what would be called a software pirate.

I look at the rules rather than from a purist point of view but from a realistic point of view.

1. Piracy kills computers because software publishers don't make software if no one buyys it. We learned this lesson with the 8-bit harder than any other compuer every made.

2. Piracy ceases to be unethical when:

1. The software is no longer avilable, and thus the software artists would not be making a profit anyway.
2. (This is highly contravercial, but I believe in it) When a person buys a certain amount of software per year, he has a "right" to pirate a certain amount: I have "pirate" friends who spend hundreds of dollars a year of software, and pirate about 6 times as much as they buy. Why? There is a limit to how much people will buy - the people I know who pirate 100 games a year or so would NEVER have bought them. But they DID help the computer and buy what they could reasonable afford. Why deprive themselves of software they wouldn't have purchased?

(If anyone wants to flame me on that, please use E-MAIL - it's not really related and could get NASTY!)

I learned the above since I listen to an obscure form of music called filk, in which a major releasing company that released about 1/2 of the filk tapes in publication just went bankrupt in 88 and put about 120 tapes that I wanted to buy out of print...I don't feel guilty pirating the tapes since they're out of print, not avilable (and I DO spend about $400 a year buying tapes anyway...)

But back to the Atari...The "crime" of piracy ceases to be an issue when it's a matter whether a (commercially) dead computer might (commercially) die when it's already (commercially) dead. Why deprive yourself of software that's not in print for the purpose of violating poorly considered laws?

I, personally, believe that computer companies should put software into the public domain after it's out for 4 or 5 years, and thus problems like this wouldn't happen!

From article <k3P951w163w@unixland.natick.ma.us>, by (Craig Rothman):
> All this talk about AMS?
> Around here AMS Is PD. Its on every single atari board there is.

Are you talking AMS or AMS II? AMS II is a vastly improved and superior version of the original AMS. I have never seen a copy of AMS II on a BBS, although I haven't looked for quite some time. I did sent a check to LotsaBytes about two and a half years ago, but never heard from them and they never cashed my check, so I assume it is sitting in a dead letter box somewhere.

Antic's AMP is a pretty nice editor and comes with a converter to convert AMP files to AMS files. It worked on the files I tried. The main disadvantage is that there was never a player that would cycle through a disk full of songs. You had to load each one into the editor and then play them.

4243. AMP

Newsgroup: comp.sys.atari.8bit
Date: 1991-07-18 21:52:06 UTC
From: psteffn@GNU.AI.MIT.EDU
Message-ID: <9107182152.AA19132@pogo.gnu.ai.mit.edu>
Source record: 113947

Does anyone know about the origins of the AMP that was published by
Antic? If anyone remembers a game called Alternate Reality [perhaps,
one of the most impressive games every done on the 8-bit] . The
original author, Phillip Price, wrote a music system called the
Advanced Music Processor for his partner, Gary Gilbertson, to
compose the music for AR The City [he y. Phil Price moved up to Lompococ
from Hawaii which is quite close from where I live and a friend and
I went up to meet him. This was a couple years back and he was
doing some kind of data processing work for bu business programming then. I don't While my friend and I were there
were there, we asked if he was going to give out some of his any of the early
version s of his AMP music demonstrattunes that Gary Gilbertson wrote. or his AMP program now that he
isn't going to be sold all rights to the AR series to Datasoft. He called up Gary
on the phone to ammake sure and then gave us a copy of one disk containing
a boot loader menu that had songs written with howed the eacontained several of Gary's compositions
on and showing the progression of the AMP system from version 1 to
11.2, I believe. He also gave us a copy of a disk containing
a few of the latter AMP's that used graphicscharacter based Graphics 2 mode character
animation. He also uploaded them to Compuserve and Genie. The reason
I'm posting, tho, ugh, is that the AMP in Antic didn't have Phil Price's name
name on it although ist is very suspiciouslyfar to similar to his PAMP to be coincidence.
I got the impression that he was humble but but I can't imagine not putting
his name on such a fine programiece of hard work. Id'd hate to see someone else
take credit for it..

If anyone here ever stops by a chain called Book Warehouse,
they are now selling copies of "Zap! The rise and fall of Atari" in
hard cover for $1.97!!! It does an excellent job of covering the
early days of Atari (i.e. pre-1981) but fizzles afterwards, but for $2
it's worth it!

Also, to "leekil@bbn.com", I mailed you a 2 page message, but
according to my mailer, you don't exist. Could I get a different
address that the Nasa Nauseating Murky Mailer would handle? (The
foo!bar!baz types normally work well...) thanks...

Source record: 113948

I am familiar with some of the stuff you mentioned. The Animation Station is a touch tablet packaged with some drawing software. The s/w is pretty good. The touch tablet works like a pair of paddles, which means you can use the s/w with a pair of paddles or some other electrically similar device (and I have a few of those.) The s/w lets you draw squares, circles, ovals, text, etc. and allows you to print out your creations. The color selection screen is really well done. You can NOT do DLI's (which allow you to have > 4 colors on the screen at the same time) or any other fancy h/w graphics schemes, but overall, the package is pretty good.

MidiTrack II and MidiTrack III are two versions of a software MIDI sequencer for use with the Midimate interface. All these products come from Hybrid Arts. They ARE still in business. I have their address at home and can post it if people are interested. I have MT III at home. It's a neat toy, but hardly useful for serious MIDI sequencing. Nevertheless, I am putting it to use, and I want to write a couple of small MIDI utilities that will work with MT III this summer yet. Hybrid Arts is generous with technical information on how MT III stores its files on disk, etc. If you want to do MIDI on your Atari, these packages are pretty good (although a little expensive). If you want to do serious MIDI sequencing, get an IBM or Mac or ST.

The R-Time 8 is a clock cartridge powered by a regular lithium cell. Use it with SpartaDOS to keep an accurate time/date stamp of files. The cartridge is piggybacked so you can have it and another cart at the same time. The Newell fastchip is a chip which replaces the floating-point chip to give you faster math operations. Ramrod 800 is (I think) a board that lets you have multiple operating systems in an 800. I don't have any of these last 3 so I don't know too much about them.

I have had Atari joysticks, Slik Stiks and TAC IIs by Suncom, 500XJs by Epyx. For any game where you punish your joysticks, use Atari. 500XJs are good for accurate movement (I like them for Tetrix) but the diagonals are tricky to master. Plus, they're built with a good measure of planned obsolescence, not quite as durable as I would expect. I really liked the Slik Stik until it broke, and I couldn't find another. TAC IIs take some getting used to because they're bigger than others.

The trackball is a unique device. It has a switch on it to go btwn trakball and joystick emulation. I have one, but I never use it. I wanted to make it work like a mouse, but no success yet. I think I may have to do some rewiring.

Hope this helps.

> 120 READ B
> 130 PUT #1,B
> 140 NEXT A
> 150 CLOSE #1
> 160 DATA 255,255,16,0,16,0,112,14,210,14,210,112

As you can all tell from reading the code, :-), the above BASIC program writes an Atari "binary load file" which, when loaded by DOS, causes the same things to happen as would happen if, in BASIC, we typed

POKE 16,112:POKE 53774,112

For what it's worth, I thought I'd mention that it's possible to do this type of "binary-load POKE" directly from the keyboard in most DOSes I've used, by doing a binary load from file "E:". I've never seen this dicsussed in this net or any of the once-many Atari 8-bit publications, and I like to think I've invented something "original."

The tricky part is in figuring out which keys to type to get the proper sequence of bytes. I'm not on my Atari just now to work out the key-strokes which would perform Steven's POKEs, above, but a POKE I find useful quite frequently, especially when bopping back and forth between Atari DOS 2.0, SDX, and DOS/XL without cycling power, is the following:

Binary-load equivalent of POKE 580,1 (make RESET cause COLD start):

1) At DOS prompt or menu, invoke a binary load from file "E:". In Atari DOS 2.0 this would be "L", return, "E:" return. In SDX and DOS/XL it would be "LOAD E:", return.

This opens E: for input, giving you a blank, Graphics-0 text screen.

2) Type the following:

ESC, control-Insert -- displays dark triangle on white background,
ESC, control-Insert and is the 255,255 "flag" bytes

"D", control-"B" -- that's capital normal-video D, followed
immediately by control-B. This is the
two-byte hex address $0244, or 580 decimal
"D", control-"B" (you have to do it TWICE: a _start_ and an
end address for the binary load.)

control-"A" -- ASCII 1, the data to be loaded!

control-"3" -- sends the end-of-file signal, telling DOS
that the load is complete. You get back
the DOS menu-or-prompt.

3) Hereafter, when you press the RESET key, a COLD start will take place
just as though you had gone into BASIC and done a POKE 580,1 instead
of all this rigamarole.

I've gotten to the point where I can whip this sequence into the computer in no

time flat, and it's handy when I don't have BASIC in the system...

I think there's a difference between "Public Domain" and
"Commonly Stolen"...

As far as I know, Lee Actor has never released any of the
Advanced Music System into the public domain..

Just because "all the BBSs have it" doesn't make it legal, or
right...

It probably doesn't matter at this late time in the life of the
Atari 8-bit computer, but there's still a difference...

> be changed?
>
> -Stan
>

YEAH!! The problem is that despite what you may have been told, Bobterm isnt
really a True Vt52. Its different. It doesnt take the cursor movement
commands of a vt52. Ive tried using bobterm on UNIX and come up empty when
I have tried to use the TALK command. I get no split screen at all.
This is because the cursor location commands on bobterm ARENT the same as a
vt52. If you are using Bobterm on a unix, I have found that the backspace
can be fixed. Just try doing stty erase= (type the delete key)
Youll see ^H and it will do a destructive backspace from then on.
You may or may not need the "=" in the above, im a unix novice and im going
from memory (no doubt flawed!).
For better luck, I would use Chamelion or Kermit-65 as a vt52.

I am trying to fix someone's Atari 800. I have replaced a faulty voltage regulator inside the machine, but I need to know what the proper power supply voltage, amperage, etc. is.

If you have an Atari 800 (or XL, since both probably use the same supply), could you please tell me the specifications of the power supply unit?

I need the following info:

1. Voltage (6V? 9V? 12V?)

2. Current (AC? DC?)

3. Amperage (500ma? 800ma?)

This info can probably be found right on the unit.

Also, if someone would like to sell me the proper power supply, I would be interested in buying one.

Thank you very much!

BE CAREFUL!!!!!!!.

The old 400/800's use an AC power supply.

I believe the xl's and later use a DC power supply.

I don't have an XL, so I can't give you details on it, but I'll
try to look at my old 800 tonight and send the PS details tomorrow.

No, the XL uses a completely different power supply. However, the 800 uses
the same power supply as the 810/815/1050 drives and the same as the 850.
Unfortunatly, I have packed my machine up and put it in the garage, so the
specs are not easy for me to get. I wanted to make sure that noone gave
you false information by supplying you with the specs for the XL supply.

From: tnfw0@isuvax.iastate.edu
Message-ID: <1991Jul27.040530.5823@news.iastate.edu>
Source record: 113765

After poking around a little bit in SpartaDOS X, it looks to me like it is possibly written mainly in C (or, with a very low probability, in Action!). My main clue of this is '%10s's and the like running around, so I'm not anything like _sure_ that it is written in C... But, if it is, I would like to know what C it is written in. The code is pretty compact (efficient), although I did notice a few things that looked redundant...

I suppose I could ask ICD, if I had an net-reachable address for them (say, CompuServe...)

Later,
Steven Ourada

If it is of any interest to you a powersupply for your 800 can be obtained from American Techna-Vision, 15338 Inverness St., San Leandro, CA 94579--Tel:1-800-551-9995. The cost is $14.50. It also can be used for the 400/1200XL computers, the 810 and 1050 disk drives, the 850 Interface, the 1010 recorder, and the XF551 disk drive. It is advertised as replacing earlier "weaker" Atari units. It is an original Atari part #CO17945. Hope this helps.

4265. Stuff for sale

Newsgroup: comp.sys.atari.8bit
Date: 1991-07-29 16:11:35 UTC
From: walk@mrcnext.cso.uiuc.edu
Message-ID: <walk.680803895@mrcnext.cso.uiuc.edu>
Source record: 113769

Okay, this is the last of my stuff.
This stuff is sold "As is". The person who gives me the best offer
by about Aug. 1st for this stuff gets it (as long as I feel that the offer
is at least vaguely reasonable, that is).

52 disks w/ PD programs and misc. (~$10 as blank disks)
100 disk suitcase style carrying case w/ handle (~>=$10)
Compute's best of Atari disk
AutoDuel
One-on-One
Boulder Dash Construction Kit
Gateway to Apshai
Mail Order Monsters
Top Gunner
Legionnaire
Lords of Conquest

All programs come with full docs.

4266. Atari 8-bit stuff for sale!

Newsgroup: comp.sys.atari.8bit
Date: 1991-07-30 02:49:55 UTC
From: chuck@umbc5.umbc.edu
Message-ID: <1991Jul30.024955.2692@umbc3.umbc.edu>
Source record: 113770
Cross-posted to: misc.forsale.computers,comp.sys.atari.8bit

I have the following Atari 8-bit equipment for sale:

Atari 800 (48K)
Atari 410 (quantity 2)
U-Print printer interface
Basic cartridge
Q-Bert cartridge
Manual and Basic prog. book

Make me an offer for the lot! I want to get rid of it soon!

Also, please consider that shipping and COD charges (if necessary) are not considered part of the deal unless specified by you.

Thanks!

Chuck Rickard

4267. CC65

Newsgroup: comp.sys.atari.8bit
Date: 1991-07-30 15:35:57 UTC
From: slackey@bbn.com
Message-ID: <65414@bbn.BBN.COM>
Source record: 113771

Well, I finally got a working copy of the CC65 executables off of the atari ftp machine. I had success compiling/assembling/linking the 'hello world' program, but had to insert a blank line before the keyboard call; it was getting a space instead of one of the characters in the call. I didn't try it with my old copy of CC65.

I was sad to learn that (a) CC65 does not work under mydos, (b) it does not work with the XEP80, and (c) in reading the CC65 docs I see that the executable it generates won't work with the XEP80 either, at least due to the operand stack starting out where the driver resides. Is there some way I can fix this?

It all did work under spartados, so I got motivated real quick to reassemble EMAX (my XEP80 text editor) around the memory constraints. It did basically work; there are some modifications to do, and a bug to fix. Unfortunately, a reboot is necessary to get the XEP80 driver out of memory before CC65 can be rerun.

Anyway, I may be close to breaking by compulsive assembly language behavior. I am having fantasies of building a ROM (yes ROM) disk, with all the executables I use burned in. Yes SDX you may say, nah I say, I want to be able to put my own choices in it.
-Stan

4268. SDX drivers

Newsgroup: comp.sys.atari.8bit
Date: 1991-07-31 00:30:45 UTC
From: DE7B@br3.hrz.th-darmstadt.de
Message-ID: <1991Jul31.003045.21281@infoserver.th-darmstadt.de>
Source record: 113772

This is more or a less a test, too see whether this
is finally reaching anyone, but I have a real question
as well.
My long time project (a parallel interface between my
8-bit and my ST) is nearing completion, and after giving
up on the idea of ever writing an SDX driver, I might
yet find the motivation to do just that.

After disassembling two driver binaries (JIFFY.SYS and
XEP80.SYS) I have come across various segment headers
like
(from virtual memory (har har))
FFFE -- code (reloctable ?)
FFFD -- (relocation data ?)
FFFC -- ??
FFFB -- link symbol
FFFA -- dito

or some random permutation of the above. If anyone wants
real facts I can look them up...
Anyway.. Has anyone yet cracked that scheme ?

Greetings
Nat!

P.S. Still looking for: Excalibur, Eastern Front, Oper. Whirlwind

Your project sounds very interesting. I considered doing something similar,
but stopped because of the save problem in writing a driver. Let us know if
you come up with anything else! Oh, I have the Eastern Front cartridge (but
no manual)...

4270. 8-bit software for sale.

Newsgroup: comp.sys.atari.8bit
Date: 1991-08-01 20:29:55 UTC
From: dddean@bluemoon.uucp
Message-ID: <kgP161w164w@bluemoon.uucp>
Source record: 113774

Hello:

Due to a bad misfortune, I must sell my Atari 8-bit software.

I have many titles to choose from, and each title will go to the first
people that can reply.

Among the titles are:

Mail Order Monsters One-On-One
Spy Vs. Spy I and II Spy Vs. Spy III
The Pawn Ace of Aces
Gauntlet Boulderdash/Super Boulderdash

All titles will sell for $10 each. You pay shipping/handling.

Thank you, and for other titles, I may have it.

You can send any replies to:
David D. Dean, President David D. Dean, Vice Chairman
Explorer Post 891 Exploring Officer's Association
AT&T Systems/Bell Labs Central Ohio Council
dddean@bluemoon.uucp Columbus, OH 43227

**** Any opinions are that of the author, and NOT of AT&T ****

4271. SOFTWARE PIRACY & OTHER STUFF

Newsgroup: comp.sys.atari.8bit
Date: 1991-08-02 14:22:07 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9108021422.AA09699@smithkline.com>
Source record: 113775

First, many thanks to the [several dozen] folks who responded to my test message to USENET. Most of the individual thanks I tried to send got bounced back. From that exercise I learned 2 things: the mailer at my facility is a brain-dead piece of junk (our sysadmins promise a new one coming some day); the other thing is our sysadmins appear to be equally brain-dead. I'm just a lowly user here, my ignorance of the system is profound. If only there was a manual somewhere..... .

In recent pstings to this newsgroup there has been much discussion on the subject of piracy, I have watched the thread run this way & that. In the July issue of Current Notes I hung a blatant software pirate out to dry. The company was called DataRush, operated by a fellow named Walt Huber out of CA. This case bordered most of the issues tossed about in this newsgroup. Huber began his career by operating in the shady side of the legality of this issue: he sold copies of commercial software that had been discontinued, abandoned, or was formerly distributed by companies now out of existence. Although what he was doing was probably illegal, I neverthelss gave him a positive endorsement in the Dec 1990 CN because his activities did not appear to be causing harm to ant programmers/vendors/developers presently active in the market. Then in May he suddenly went hog-wild & added a large number of commercially available programs to his inventory. That was unacceptable: I had no choice but to come down hard on him.

The fact is there is still a goodly amount of commercial software available & even several developers who are continuing to release new material into the market. The once-large commercial houses make almost nothing on the few sales of Atari software still made, but these sales are important to the 8-bit vendors who still manage to make aliving at it. An operation like DataRush is a real threat to the existence of the few 8-bit vendors we have left. When all is said & done, theft is still a crime, & it DOES hurt our market. My initial tolerance of Huber was a mistake, I wish I hadn't done it. Huber rubbed my face in humble pie, something we Alchemists have a strong distaste for.

In other matters, I noticed several postings related to power supplies for 8-bits. The 800 powers supply is just an AC 9V transformer spec'd to deliver 3.5 amperes. In November 1990 Current Notes published a long detailed article on XL/XE supplies, complete with actual test data of current delivery, plus photos, circuit diagrams & tekkie descriptions of how the circuits work. It was a good article, I know, I wrote it. If you own an Atari 8-bit & don't receive Current Notes, you're missing the boat.

4272. 1400XL

Newsgroup: comp.sys.atari.8bit
Date: 1991-08-03 07:50:41 UTC
From: mfolivo@sactoh0.sac.ca.us
Message-ID: <1991Aug3.075041.29626@sactoh0.sac.ca.us>
Source record: 113776
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

The other day, I saw these two interesting items for sale at a computer store, and I have a dew questions.

There were two 1400XL computers, presumably FCC test and/or Atari engineering models for sale. One had a 1450XLD label (It obviously wasn't, no metal case and DS built in drive) and the other had no label. These were 1400XLs, they had the PBI and the modem connections (RJ-11) THey were offering $150 each, and they guy behind the counter grunted they worked.

The other was the 1090 expansion box, with some memory board in it. It had no price.

So, what is the going price for these pieces of Atari trivia? I know that 1450XLDs have value, but a 1400XL? (I'd still like to find an XLD, I'm about one of ten DOS 3 users left on the planet. And DOS 3 was designed for the XLD drive)

By the way, the 1090 box had no cover.

I had heard that Antic (rest in peace) had a 1090 holding a door open...

Anyone know what happened to the other "lost" Ataris, like the 65XEP, 130ST, 65XEM, 121XDM, et al?

I OH SO WANTED one of those 1450XLD's. I really did. But they got canned when Tramiel, took over the place.

What a package I thought! But, we got the ST instead...:)..Darn eh?

I would pay for a 1450XLD, just as a collectors item. If anyone has one, let me know how much it would take to part with it.

I have seen adds for mother boards for 1450XLD's, complete, just no chassis to put the guts in. Which is sort of a shame cause in my opinion the machine looked nice.

But I still like my MEGA STE a lot better. :) Did I mention it also runs software a little bit faster too?

But, anyway...save your money and buy a NeXT station. Did you know they got X R4 for it now?

But seriously, hopefully the TT's price will come down to about $1500.00 retail for a 4 meg 80 megabyte/HD configuration. I think that would be a reasonable price for a TT, with its abilities.

What do the rest of you think?

4274. Sigh. Stuff for sale...

Newsgroup: comp.sys.atari.8bit
Date: 1991-08-04 19:10:10 UTC
From: exuhag@exurchn1.ericsson.se
Message-ID: <1991Aug4.191010.16414@exurchn1.ericsson.se>
Source record: 113778

Way back when I used to be a somewhat frequent writer for ANALOG, Antic, and COMPUTE!, and although I've been out of touch with the Atari 8-bit world for a couple of years now, I haven't been able to get rid of the ton o' stuff that I have sitting around. And I still can't. But I have found a FEW extra things with which I can part without too many second thoughts. Anyway...

MPP 1150 PARALLEL PRINTER INTERFACE. This is in the original box with the original instructions. Believe it or not, I only had this contraption hooked up for THREE DAYS so for all intents and purposes it is BRAND NEW. There is absolutely nothing wrong with it and it works fine--email me if you absolutely must know the reason for its lack of use. $15 (this is a real bargain). I'll pay shipping.

"AN ANALOG 8-BIT EXTRA" FROM ANALOG COMPUTING, 1987. Contains quite a few listings of BASIC and ACTION! progams of the typical ANALOG quality. My copy is in good condition. Originally sold for $8.95, but I'll sell it for $3.00--and that includes shipping so I'll lose money in the deal.

I've also an extra copy of ANALOG COMPUTING #52 (March 1987) which I'll simply give away for a 9x12 SASE with enough postage. ANALOG screwed up and sent me a duplicate copy of this issue so it has never been read.

Well, that about does it. I have LOTS of development type o' books and software (and, of course, games), which I'm not using but am not quite ready to get rid of yet. If you are really having trouble finding a particular item (and I know how it is these days), send email and maybe I can work something out.

Once again: sigh.

4277. CURRENT NOTES

Newsgroup: comp.sys.atari.8bit
Date: 1991-08-05 20:15:18 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9108052015.AA02090@smithkline.com>
Source record: 113781

Sheesh, I didn't expect to stir up so much interest in Current Notes, the ST phreaks mostly know about it pretty much. I had a number of individual responses to my posting in IA8 V.91 #59 requesting info about CN. Unfortunately our Mesozoic-era mailer here bounced half the responses I tried to send, so I'll post the info to the whole newsgroup. BTW, if you are on any other net besides INET & try to send me mail, be aware I probably won't be able to reply to you directly, especially if there's no indication which net you're coming from (all my received mail contains truncated headers, I'm almost blind here). I can send to INET, BITNET, & one or 2 others I think.

Current Notes began as a grass-roots usergroup newsletter in the Washington DC area around 1982 or so. Several other local UG's liked it, utilized it for their newsletter also, then groups from a wider geopgraphical region joined in, by 1986 the thing grew to where the mag split off from its parent usergroup & became indepent as Current Notes Inc. We now have usergroup affiliates all over the the country. Our total distribution is somewhere ca. 5000-6000 or so, including a few overseas subs. The subscriber base is about 10% 8-bit only, 30% owners of both 8-bits & ST's, & 60% ST owners. The edititorial content is roughly allocated according to the makeup of the distribution base, so much of the mag is devoted to the ST. CN is published 10 times/yr; I try to get four 8-bit articles published in each issue. I expect we will end up publishing 35-40 8-bit articles in 1991. 8-bit material consists of software reviews, tutorials, occasional short type-in demo software, & hardware articles.

I'm the 8-bit Editor. I run a monthly column called "The 8-Bit Alchemist" which is devoted to hardware hacking plus news of developments in the 8-bit marketplace. Since Dec 1990 I've also featured a section called "Twilight Sources" which profiles mailorder vendors of 8-bit stuff. So far I've reported over 25 such sources. My Sept column will feature a major hardware hack that will clean up the smeary video in the 600XL/800XL using $7 worth of parts you can buy at any Radio Shack store. I also edit all the 8-bit articles that go into each issue, distribute review samples & coordinate the efforts of a staff of 17 people spread all over the USA & Canada. I presently devote 25hrs/week to CN, with no pay (the mag has only one paid full-time staffer). This in addition to the 45-50 hrs/week I put in on my regular job as a research chemist.

CN is a tough mag. Good products get good reviews, lousy ones are brutally exposed. We have low tolerance for baloney & have tangled with Atari on a few occasions. Our publisher is Joe Waters who does all the DTP from his house & whose philosophy is that CN is devoted to USERS, not to Atari Corp or marketplace developers. Although there's a lot of ads in CN, I understand we are financially self-sufficient on the subscriber base alone. Being financially independent we owe nothing to our advertisers & will subject their products to the same high standards we set for everyone. The editorial content is excellent since mant regular contributors are professional people, highly educated, with Atri interests that go way back to the early 8-bit days. The editorial content is well-seasoned with a pungent blend of wit, humor, sarcasm, & above all a very

human element. We just went to full-color covers in June, but by no means are we an ANALOG or STart/ANTIC type slick full of hype & slavish devotion to the Tramiel Entente.
Individual subscriptions are available for $27/yr, a little less ($23) if you are a member of a CN affiliated usergruop. Send ypur check to:
CURRENT NOTES INC.
122 N. Johnson Rd.
Sterling VA 22170
ATTN: Joyce Waters
They also take VISA/MC, & Canadian/foreign subs cost more. For info call: (703)450-4761.
Back issues, to ca. 1987, are also available, for ca. $1.50 ea. I think. Please don't send money to me or anything, I'm just an Editor & have nothing to do with the business end of the magzine.
BTW, if anyone on this newsgroup does elect to subscribe to CN, tell Joe The Alchemist sent you. Heh, if we build up the 8-bit portion of our subscriber base, maybe Joe will have to let us have FIVE 8-bit articles per issue, nyuk! nyuk! nyuk!
Following the demise of ANTIC, CN is now prety much the las t game in town for 8-bit owners. Spread the word!!!!

4280. RECENT ITEMS OF INTEREST IN CN

Newsgroup: comp.sys.atari.8bit
Date: 1991-08-06 21:13:26 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9108062113.AA03725@smithkline.com>
Source record: 113785

Following a couple requests for info about interesting hardware-oriented type articles that have appeared in Current Notes, I have compiled the following brief list for anyone who might want back issues. Not all of this stuff is "build it" type projects; some are tutorials, etc. Anyway, here goes:

Jul/Aug 1990: "Atari on the Test Bench"
Oct 1990: "Magic Juice" (using Cramolin to improve connections)
Nov 1990: "Secrets of XL/XE Power Supplies"
Jan/Feb 1991: "Secrets of the 1027 Printer"
Apr 1991: "80-Column Switcher" (switch between 40-col & XEP80)
May 1991: Adding stereo to XL, hardware & software, 3 articles
Jun 1991: MacInker, ribbon inking, more on 1027
Sep&Oct 1991: "Super Video Rev 2.0", in press, a major tutorial on 8-bit video interfacing, monitors, & a $7 upgrade to clean up smeary video on the XL machines.

Subjects currently in the pipeline, to be published between Nov. 1991 thru Jun 1992:
Secrets of the 1050 Disk Drive
Setting Up 8-Bit Hard Drives (2 articles)
Rebuilding the Type I Supply So It Delivers 2 Amperes
Using 3.5" Drives with the 8-Bit (2 articles)
US+ OS from CSS
BobTerm vs. Express! ROMcart
MyDOS vs SpartaDOS

Long-term stuff, kicking around on the back burner:
Build Your Own 850 Interface
Secrets of the XEP-80
Super Video for the XE
ST Slaved to an 8-Bit
Use a TTL Monitor With An 8-Bit
Use the SM124 with an 8-Bit

Some of this stuff, we're not even sure if it will work. My philosophy is, "Do the hack. If it works, publish!"

Anyone with an idea you want to work on, post to the newsgroup (not to me!) I'll monitor the chatter & let you know if I think it's worth doing.

The Alchemist has 2 pet programming projects he would dearly love to see transmuted to functional software. These are basically dedicated graphics-type things with a professional orientation, well within the capabilities of an 8-bit especially one with upgraded memory & an XEP80. If this piques the interest of any programmer-types out there, post to the net. These ideas have commercial potential if the implementation is done well enough.

I tried to mail you after I read your posting here on comp.sys.atari.8bit,
but I couldn't get through to you either!

I am willing to sell you the Gauntlet and Spy Vs. Spy III both for $15.
But you need to pay the shipping.

Call me at (614) 235-6996 to set up the more important details.

(Sorry to the rest of you that are reading this, but the mail delivery
isn't working between the two of us! "Thank you for your support!" :-}
)

You can send any replies to:
David D. Dean, President David D. Dean, Vice Chairman
Explorer Post 891 Exploring Officer's Association
AT&T Systems/Bell Labs Central Ohio Council
dddean@bluemoon.uucp Columbus, OH 43227

4284. Target compiler for FIG FORTH

Newsgroup: comp.sys.atari.8bit
Date: 1991-08-08 17:50:01 UTC
From: tnfw0@isuvax.iastate.edu
Message-ID: <1991Aug8.175001.16925@news.iastate.edu>
Source record: 113788

This is kind of a long shot, but I'm wondering if anyone has the target compiler (one that makes a file or boot disk) for FIG FORTH on the 8bits. I am pretty sure one exists, since the error screens have a couple of error messages concerning one, and I've seen at least one application as a DOS file that started as a FORTH program.

If anyone has one or knows where I can find one, please tell me... I would have liked to have one quite a time ago, but I would still like to have one now.

- Steven Ourada Email: TNFW0@vaxf.iastate.edu or ar550@Cleveland.freenet.edu

4289. Legendary Atari stuff for sale

Newsgroup: comp.sys.atari.8bit
Date: 1991-08-13 01:09:01 UTC
From: Chris_F_Chiesa@cup.portal.com
Message-ID: <45533@cup.portal.com>
Source record: 113795

Hello all!

Due to circumstances you'll find detailed below, the author (well,
"porter" at any rate -- still no small achievement) of Kermit65 and CC65,
John Dunning, finds it necessary to sell off his Atari 8-bit equipment.
(Due to yet ANOTHER piece of circumstance, his *NIX host won't let him post
news (hence his heretofore unexplained silence during the recent discussion
of Kermit65), so he has asked ME to post this FOR him.)

John wants "to find a good home for the hardware," which gives YOU and
ME the chance to pick up The Very Atari On Which Kermit65 Was Made, truly
a piece of Classic Atariana if ever there was one!

I tried to post this a few weeks ago but John says HE never saw it and
he has received NO responses, so I can only assume Portal crapped out (it
does a lot of that, unfortunately) and didn't post it when _I_ did....

Without further ado, then, I present the Opportunity Of The Decade:
John Dunning's for-sale announcement! Be sure to reply via e-mail to JOHN's
address, seen below, NOT to MINE.

Chris Chiesa
Chris_F_Chiesa@cup.portal.com
-------INCLUDED TEXT FOLLOWS-----------------------

4290. John Dunning system for sale

Newsgroup: comp.sys.atari.8bit
Date: 1991-08-13 01:13:48 UTC
From: Chris_F_Chiesa@cup.portal.com
Message-ID: <45534@cup.portal.com>
Source record: 113794

Good ol' Portal... I hope the introductory part of this posting got to the Net, even if it DID go flying off without the intended appendix of John Dunning's "for sale" message. This makes the THIRD try at posting this thing...

To recap, the author/porter of Kermit65 and CC65, John Dunning, is forced by circumstances to a) sell the Atari 8-bit environment in which his wonderful programs were hammered into form, and b) ask ME to post his for-sale message on his behalf. I feel that this is somebody's golden opportunity to purchase a piece of Classic ATARIana, namely the Very System On Which Kermit65 And CC65 Came To Be.

John's own for-sale text follows, below! Really! This time I MEAN it!

Chris_F_Chiesa@cup.portal.com

PS - don't send e-mail to ME; John's net address appears as the first line of his included text!
----- INCLUDED TEXT FOLLOWS -----

From: John R. Dunning <jrd@STONY-BROOK.SCRC.Symbolics.COM>

Yup, it's another for-sale notice for 8-bit equipment. After realizing that it's been 3 months since I've powered up any of the stuff, I decided it's time to get out of the 8-bit business. Everything must go! All equipment is in "like-new" condition except as noted.

Atari 130XE computer
Atari 800 computer
Atari XF551 disk drive
2 Indus GT disk drives
Atari 810 disk drive (electronics broken, mech ok)
Atari 850 Interface
Magnavox color monitor (with green mono mode)
ICD Printer connection
ICD Spartados X cart
Avatex 2400bps modem (suffers heat problems)

Also some books:

Inside Atari DOS
Mapping the Atari
Atari OS internal manual

Game cartridges:

Star Raiders
Pac Man

Defender
Submarine commander
Centipede
Basic

Best offer accepted for all of the above stuff (and anything else I find while I'm cleaning off that desk). I'd prefer to sell the whole works, rather than being left with extra pieces, but no reasonable offer will be refused! I'll take bids on it for the next couple weeks or so. Much of the stuff comes with original boxes. I'm willing to ship it, but if anyone in the Boston area is interested, such that it can be picked up, that'd be an advantage.

Please respond via e-mail, JRD@Stony-Brook.SCRC.Symbolics.COM.

[...] And not to worry, I'll still keep the list and archive running. Our favorite machines aren't dead yet!

4291. What are the advantages of the newer 8-bit computers?

Newsgroup: comp.sys.atari.8bit

Source record: 113797

Hello,

A long time ago, when the 800XL first came out, I bought one ($249.95 at "Toys R Us", whew!) and Panasonic 10" color monitor. I was very impressed with the quality of the video.

Anyway, about a year ago picked up a used 800, and have been using it on a crappy old TV. I've never seen the capability of the 800's composite video signal, and I'm wondering if I buy a monitor, if I'll get as good a signal as if I was using an XL/XE system.

Other than the obvious memory increase provided by the 130XE for instance, are there any other advantages over the 800? I'm wondering if I'll ever be able to get decent quality 80 column emulation, etc...

=>
One thing you may miss is the RAM under the OS. Some software uses this
space and won't run without it. Also, there are some changes to the OS in
the XL/XE, so some stuff won't work properly.
For 80-column emulation, you could try Kermit-65. It is free for the
FTPing, and ought to work on an 800 (though I haven't actually tried it).

4294. some interesting behavior

Newsgroup: comp.sys.atari.8bit
Date: 1991-08-13 15:34:45 UTC
From: slackey@bbn.com
Message-ID: <65715@bbn.BBN.COM>
Source record: 113796

I use mydos with an unmodified XF551 and a 1050 with US Doubler. Mydos can properly use the 1050 as true double density as well as enhanced density and single density, and the XF551 in DSDD, SSDD etc. modes.

I have noticed that, for the doubled 1050, the drive/OS seems to be able to "autosize" based on the disk in the drive; If I put in a SD disk and read it, mydos immediately recognizes it and sets up stuff accordingly; if I remove it and put in a DD disk, again just reading ends up reconfiguring and accessing in DD mode.

However, the XF551 does not do this apparent autosizing. It seems to "downgrade" properly; if it can't read, it goes down to SSSD and can access. IF then I put in a DD disk, it forever gets errors until I go the process of telling DUP to reconfigure the drive.

I imagine the reason for this is the drive; the US doubler does a better job of dealing with different disk formats than the XF551.

I have the sources to mydos and can change it to try different densities before giving up. I guess I am impressed that it works automatically with the 1050, though. Does anyone know the mechanism by which this works?

Also... wrt the XF551, is there any way to tell if the disk in the drive was formatted DSDD or SSDD?

Also... I have found that I cannot switch the XF551 between SSDD and DSDD under certain circumstances; I forgot the exact details, but I have found that switching modes then writing causes the disk to get corrupted (error 164 is it?) and was wondering what the problem is.

-Stan

There is still one Atari 8-bit magazine in existence in the UK-
Page 6 Publishing's 'New Atari User'. I can highly recommend it.
This magazine (once known simply as 'Page 6') has been going since the
400/800 days and is a very professional publication produced bi-monthly
by 8-bit enthusiasts. It also contains coverage of the ST.

An subscription (6 issues) outside the UK costs 15.00 pounds sterling
for surface mail or 21.00 for airmail. Contact:

PAGE 6, PO Box 54, Stafford, ST16 1DR, England.
Telephone subscriptions (VISA/ACCESS/MASTERCARD):/ +44 785 213928.

I am in no way connected with Page 6 Publishing.

4299. Portfolio - program development restrictions?

Newsgroup: comp.sys.atari.8bit
Date: 1991-08-17 15:39:33 UTC
From: abe@wet.UUCP
Message-ID: <2840@wet.UUCP>
Source record: 113804

I was given an Atari Portfolio and want to write a program for it. I will be writing in C on a UNIX system (small memory model - 64K) and plan to compile on a MS-DOS machine with a Borland compiler. I have heard that the Portfolio DOS is not 100% compatible with MS-DOS.

How can I ensure that my program will actually work on the Portfolio - are there any restrictions or things to avoid?

Is this the right newsgroup?

Thanks!

Dave Abercrombie

Well, Actually its not the right newsgroup because this one is for owners of the atari 8 bit line... However, I am not sure if theres one for Portfolio owners out there. On the off chance someone owns an 8 bit ANDportfolio, or a portfolio owner reads this thing and knows the answer, It wasnt a bad move. Hopefully someone can respond to your post, but my guess is that it will show up in private email.
Not too much portfolio chatter around these parts.

Message-ID: <1991Aug18.172704.20905@usenet.ins.cwru.edu>
Source record: 113705

Yes, the BobTerm handler does work with Kermit. I use it with
a real R-verter with my SuproModem 2400 (sadly, the 80 col screen
isn't too reliable at 2400bps). Make sure you attach it to the
KERMITNR.COM version (use the append version of the copy command
to copy KERMITNR on to the driver (a COPY of the driver!)).
For dialing--I don' know if this will work on the SX212, but it
is a Hayes command and will work on my Supramodem. If the number
you dialed was bucy, just type "a/" to redial it. No ENTER is
necessary. I think Hayes compatible modems are supposed to
have a redial command (automatic) but I don't know what it is.
(If whoever reads this knows, please let me know!)
Thats all I have!
Kevin

4303. $19.99 SX212

Newsgroup: comp.sys.atari.8bit
Date: 1991-08-18 21:22:55 UTC
From: fseipel@magnus.acs.ohio-state.edu
Message-ID: <1991Aug18.212255.13555@magnus.acs.ohio-state.edu>
Source record: 113707

I just thought I'd tell everybody that Damark reduced the price of
the SX212 down to $19.99 + $5.50 S&H. You can call 1-800-729-9000 to place
orders. It was $29.95 in the last catalog. The SX212 is a direct connect
(no interface required) 1200 baud modem that works with all Atari 8-bits.
It works with most terminal programs, such as Bobterm. Item #B-475-181504.
BTW I'm not affiliated with Damark, just passing along information on a
good deal.

re: Kermit-65 at 2400

Let me guess - you lose characters sometimes when it scrolls (at 2400baud)? There's a setting that will take care of that (type set at the menu and see the options - one will I believe do a XON/XOFF to keep the screen from losing characters).

Robert Anisko

Be careful of this deal. I ordered one of these from Damark. It was a great price and I received it relatively promptly. The modem I received was defective (kept getting spurious characters frm the phone line. I returned it for replacement (they paid for postage, still not bad). The new one I just received has the same problem. I checked my phone line using a known good modem, so it's not that. I haven't heard that the SX212 is inferior, but Damark must have gotten a bad batch. My only loss was the two stamps used to send my shipping receipt for refund, so no big loss, just dissappointment.

The better newsgroup might be 'comp.sys.palmtops' which is
where most of the Portfolio owners hang out (as well has the
HP-95LX owners).

Yes! Flow control worked! All right! One other question--is
there any way in Kermit to set the backspace character to the
other one? (I think ^h). Backspace doesn't work well the way
it is set. I Can't backspace when I am typing commands to my
modem!
Thanks for the flow-control suggestions!

4310. Program for IBM to read and write Atari floppy?

Newsgroup: comp.sys.atari.8bit
Date: 1991-08-20 18:43:27 UTC
From: endter@pioneer.arc.nasa.gov
Message-ID: <1991Aug20.184327.5372@riacs.edu>
Source record: 113713

Does anyone know of a program which will read and write Atari floppy disks
on an IBM PC? I would like to use the disks in a 1050 disk drive running
Atari DOS 2.5 with an Atari 800.

Also, does anyone know where I can get an 800XL cheap?

Thanks,

Bill

Well, the closest I could find was a program called ATARIO.ARC at
msdos.archive.umich.edu in the /msdos/disk directory, which reads
and writes Atari DOUBLE DENSITY disks (no single or enhanced
however :-(. Of course, you could get a US Doubler ($25 or less)
for your drive, and SpartaDOS-X and probably could use it.
Regular SpartaDOS probably works, but you'd have to remember to
format in ATARI mode and NOT Sparta mode.

Hope this was at least a little helpful...

Source record: 113716

Hi,

I'm looking for places to order 8-bit hardware. I can no longer find START magazine, and was wondering if anyone could post a few places to contact regarding hardware purchases...

I'll be around for a few more days, and then out for 3 weeks...

I really want to get a CX77 tablet, monitor cable, and perhaps an 850 interface...

Many thanks in advance,

John

-.-.-.-.

Someone here asked for some 8-bit mail-order sources, since he was
having ahard time locating any without STart magazine around anymore.
The following is a file I created about 3 months ago, listing most
of my known sources for 8-bit support. I hope some of you find it
useful....

The Atari 8-bit computers are one of
finest home computers ever designed.
Unfortunately, after some 12 years on
the market, software and hardware
has become very difficult to find.
Hopefully this file will help you
extend the life of your Atari. The
following is a list of companies and
individuals still marketing items
as of 5/1/91.

Software Infinity
642 East Waring Avenue
State College, PA 16801
Notes:Good PD selection. Have just
begun marketing commercial games
from overseas.

B&C ComputerVisions
3256 Kifer Road
Santa Clara, CA 95051
(408)749-1003
Notes:Huge selection of software
and hardware items. Also some new
commercial games, unavailable
elsewhere.

Sagamore Software
2104 Arapahoe Dr.
Lafayette, IN 47905
Good PD/shareware selection with
extensive documentation.

Change In Heat
12 Bella Vista Place
Iowa City, Iowa 52245

Independent programmer has produced
2 excellent commercial quality
games for the 8-bit.

Bresnik Software
555 Ware Street
Mansfield, MA 02048
Another independent, producing good
educational software yet.

UltraBasic
10 East 10th Street
Bloomsburg, PA 17815
8-bit speciality software.

NERDS Software
18 Wendy Drive
Farmingville, NY 11738
Printshop related software.

IB Computers
9244 S.W. Beaverton-Hills Hwy
Valley Plaza Shopping Center
Beaverton, Oregon 97005
(503)297-8425

BellCom
PO Box 1043
Peterborough, Ontario, Canada K9J7A5
The largest PD/shareware selection.

Compsult
PO Box 5160
San Luis Obispo, CA 93403-5160
Closeout items galore.

No Frills Software
800 East 23rd Street
Kearney, NE 68847
Closeouts & Printshop graphics.

Miles Better Software
219/221 Cannock Road, Chadsmoor
Cannock, Staffordshire WS11 2DD
England
An overseas mail-order source for
the Atari. They have many games
which were never released in the US

Electronic Clinic
4916 Del Ray Ave.
Bethesda, MD 20814
Refurbished equipment.

Kake Software
9 Smith Ct.
Vincentown, NJ 08088
assorted theme disks.

Bacmun Software
1671 East 16th Street, Suite 629
Brooklyn, NY 11229
PD theme disks.

Alpha Systems
1012 Skyland Drive
Macedonia, OH 44056
Utility software & hardware.

American Technavision
15338 Inverness Street
San Leandro, CA 94579
(415)352-3787
Large selection of commercial
software at closeout prices, and
hardware replacement parts.

Best Electronics
2021 The Alameda, Suite 290
San Jose, CA 95126
(408) 243-6950
Known as *the* Atari hardware
store. If they don't have the
part you need, nobody does.

BRE Software
352 West Bedford Ave, Suite 104
Fresno, CA 93711
PD/Shareware.

C&T ComputerActive
PO Box 893
Clinton, OK 73601

Chameleon Software
1013 Marvern Drive East
Chambersburg, PA 17201
New & used 8-bit software and
hardware.

MWPDS
890 North Huntington St.
Medina OH 44256

Phantoms Atari 8-bit
Box 331 Levisa Road
MouthCard, KY 41548

Vulcan Software
PO Box 692
Manassas VA 22111-0692

Walt Huber
644 East Clinton
Atwater, CA 95301
Discontinued software galore, as
well as some original programs.

Innovative Concepts
31172 Shawn Drive
Warren, MI 48093
(313)293-0730
accesories, hardware, PD software

CSS
PO Box 17660
Rochester NY 14617
(716)586-5545
Specialty hardware items, 8-bit
repair service.

San jose Computers
640 Blossom Hill Road
San Jose, CA 95123
(408)224-8575
New and reconditioned hardware
and software

Entertainment Excellence
1805 Princeton Place
Merrick, NY 11566
Discontinued 8-bit software.

East Hartford Computer
202 Robert Street
East Hartford, CT 06108
Discontinued software for all
computers.

Aerion Software
PO Box 1222
Riverdale Station, NY, NY 10471-1222
Markets a new 8-bit commercial
game.

Toad Computers
556 Baltimore Annapolis Blvd
Severna Park, Maryland 21146
(301)544-6943
Now offers a selection of software
and reconditioned hardware.

When writing to request catalogs,
it's always a good idea to include
a Stamped, Self-Addressed Envelope.

Next, is a list of magazines still
supporting the 8-bit Atari.

Current Notes
122 North Johnson Road
Sterling, VA 22170
A truly excellent Atari-oriented
magazine, supporting both 8-bit
and ST.

AtariUser
113 West College Street
Covina, CA 91723
A new Atari publication covering
the full line of Atari products.

AIM
3487 Braeburn Circle
Ann Arbor, MI 48108
Joint effort of lots of user groups
throughout the US; both ST and
8-bit support.

Just curious - why would you need documentation for a monitor? I used
to have a 1702 monitor (the 1802's predecessor) and IF it is relatively
similar, I can help out a little. If I remember, there was I think
in the front of the monitor 2 RCA jacks - Audio and Visual. If you have
a XEP80, you might want to plug it into these slots. Otherwise, plug
the connections from your monitor cable (should be 3 extensions) into
the back, where there is a audio, and Chroma and Luma inputs (these
allow much clearer and crisp-looking visuals). I believe there also
was a switch on top, which basically switched between the front and
back inputs.

How some of this was useful to you...

4322. Re: Program for IBM to read and write Atari floppy?

Newsgroup: comp.sys.atari.8bit
Date: 1991-08-23 19:13:35 UTC
From: ar630@cleveland.Freenet.Edu
Message-ID: <1991Aug23.191335.18114@usenet.ins.cwru.edu>
Source record: 113726

Just confirming what the previous reply said. IBM drives are not capable of reading Atari single or enhanced density disks. I worked on that Atario program and modified it to work with double sided double density (DS/DD) disks formatted with MyDOS 4.5. (I wuld like to post it to the archive, if I knew how?) It will also read SS/DD disks, formatted with SpartaDOS X in Atari mode. If I were you, I wuld suggest scoping out an Atari XF551. San Jose Computer used to advertise them. You could use MyDOS 4.5 (free!) and get 360k per disk, automatically, and read them effortlessly into a PC with Atario. This would save you having to buy SpartaDos (but that is still a good investment- I use it most of the time unless I am planning to read the dis on a PC). Ths last time I checked, XF551 s were going for about $200.
Seeya!

In answer to question 2 (Memeory location for revision of OS or BASIC), I've dug up an old Antic from 1984. You can find the revision of BASIC by PEEKing 43234. In Rev A (original cartridge) it's 162; in Rev B (original built-in BASIC for the XL's) it's 96; in Rev C it's 234. I was sure that somewhere it showed you how to find the OS revision, but I couldn't find it, sorry. By the way, there was a Mosaic 64K board for the 800. It used bank switching and was the first I think.

>I was sure that somewhere it showed you how to find the OS revision,
>but I couldn't find it, sorry.

I didn't see the original posting, but I gather that someone wanted to know what OS revision (s)he had. I don't know about the XL's, but here's some information about how to find out on 400/800's.

In the documentation for the 410 recorder, there was you a memory location you could PEEK to find which OS revision you had. Purely from memory, I believe the location was 58616; if it was 0 you had revision A, I think; otherwise, something else.

Once again, this is purely from memory, and may be incorrect. But I do know the information was in the docs for the 410 recorder (because one OS revision might require you to position the tape at the splice between the transparent leader and the magnetic tape before you could load).

Is it possible to gain 180k (Yes I know, 720 sectors * 256 bytes/sector = 180
kb) - but when I try to format a disk in dd using DOS3 (soory, folks but it's
all I've got) from my 130xe, all I get is enhanced density (127k) ?

I've tried formatting using the call to SIOV (58457), as described in a
previous posting here, a reprint from something called "the Puget Sound Atari
News", but after having disassembled the ROM, I found that the getconfig and
setconfig commands are not found in the 130xe's ROM.

If it is possible to format a disk with 180k, using DOS3/130xe/1050, then how
is it done ? Any help will be appreciated.

You have to buy a "Happy Enhancement Kit" and make your 1050 happy!
Dos 3 does not really format in DD.

No, there is a floopy controller in the 1050 and it can only write
it's predefined formats. With the Happy you can define own disk
formats (through the direct controller access) and better transmission
rates, but you can't go over the physical limits of the drive and the
controller.

4330. 6502 bug!!?!

Newsgroup: comp.sys.atari.8bit
Date: 1991-08-27 17:19:21 UTC
From: slackey@bbn.com
Message-ID: <65982@bbn.BBN.COM>
Source record: 113733

I just read this on comp.arch:

...
A similar bug was found in the 6502 processor, and I don't think this
was ever fixed. If you made an indirect jump, and the instruction was
placed such that the two-byte address field in the instruction spanned
a (256 byte) page boundary, then the instruction would use the first
byte on the same page rather than the first byte on the next page for
the most significant byte of the address.

It was fairly easy to fix during compilation, as you just inserted a
NOP before the jump when necessary.

Torben Mogensen (torbenm@diku.dk)

Close. If you tried to do a:

JMP ($xxFF)

where xx was any two hex digits, the MSB of the JMP address came
from $xx00 instead of $xy00 (the next page). It didn't matter where the
instruction was placed, but the address referenced could not cross a page
boundary. This would probably never happen, because two byte addresses
in a table (tables of vectors is what indirect JMP is for) would probably
be aligned to start on even number addresses, and therefore, never straddle
two pages.

Hi, this is my first post to this group, and I may be mistaken, but this
sounds an awful lot like the standard protection scheme in a lot of atari
software. I was told to do exactly that to get around the protection
for copying purposes, but never found the time to get that good at
6502 assembler utilities for the atari. Any one else?

Hello 8-Bit die-hards,

My INDUS GT disk drive for my 130XE is not working.
I took it to the local ATARI dealer, and he was not
able to fix it. I would like to know where I can
send my drive to be fixed. I want my father to use
my 8-bit computer, so he doesn't consider using my
ST. If someone is selling a 5-1/4" drive I might be
interested in purchasing it from them if the price is
right. Please email me your suggestions.

Thanks in advance!

4334. "Big" screen, flickering, "R: "/"Z:", etc

Newsgroup: comp.sys.atari.8bit
Date: 1991-08-29 20:41:35 UTC
From: fseipel@magnus.acs.ohio-state.edu
Message-ID: <1991Aug29.204135.9955@magnus.acs.ohio-state.edu>
Source record: 113738

First, I was experimenting with display lists a couple days ago and found that I could add 5 Graphics 0 lines to the top or bottom of a graphics 0 display. Thus it would seem possible to have a 29 line text display on the 8-bit, by adding several 2's to display list and eliminating some of the blank scan lines (112's) at the beginning. (On some TV's it might only be possible to get one or two lines. Five seems to be an absolute maximum; the screen flickers when I attempt to add more than this).
I am able to use these lines with special programming (I put their screen memory on page six). But I would like to just use them as an extension of the normal 24 line display. What modifications to E: would be required, and how easy would it be on an XL/XE (could I just copy the OS into RAM and change a couple of bytes?)
Second, how does one avoid the flickering which occurs in a Display List Interrupt (DLI) which changes the background color of the screen? I am talking about flickering during disk I/O. It appears as if the DLI's are disabled when data is being transferred over the serial port.
I am working on a BBS program and am looking for one of those old "dual" handlers which, when PRINTed to, outputs to both screen and modem. Anybody have one of these? I could also use some short m/l subroutines callable from BASIC to do such things as send a file to R: (text mode with ^S, ^X support).
Finally, I have a working BBS program which can handle USENET newsgroups, as well as several other base types. It is read-only, but works reliably. It can handle 62^2 messages per base with MyDos, and 125^2 with Sparta. It is in BASIC XE. If anybody's interested I can send them a copy. It is missing a lot of basic features at this stage, though. Still it is somewhat interesting; made for a hard drive system, it creates a subdirectory for each user. The user data, message base info., e-mail, f-mail, etc, is (or will be for some of those!) stored in this directory. This allows for more free form user data, no fixed-length records. Of course it also has a high overhead for all those directories, but it seems to work well.

I've got no solution to offer, but hopefully this explanation will help.
I don't believe DLI's are disabled during disk I/O; rather, it's the deferred
mode VBI's. The deferred mode VBI's are disabled during critical I/O
sections, and this could account for the flickering you mention; copying
of screen colors from shadow locations (e.g. 710, 712) to hardware
locations is done during the deferred mode. When the flickering occurs,
which color takes precedence; the value in the shadow location, or the
value you're stuffing in the hardware register?

Yup, this is true. It's known as the JMP ($xxFF) bug. If you try to JMP ($3FF) instead of jumping to (high: $400 low: $3FF) it will jump to (high: $300 low: $3FF).

Another bit of 6502 trivia is the earliest 6502s didn't have a ROR instruction.

Toshi Morita

P.S. now that I think about it the fix he posted was wrong. A NOP before the instruction won't affect it. You just have to change the address of the indirect label the instruction is jumping to.

>value you're stuffing in the hardware register?

DLIs are _not_ disabled, as they are NMIs (Non-Maskable Interrupts)
and _cannot_ be simply shut off. What's happening is that during disk I/O,
the VBI routine that copies the shadow register color to the hardware register
can't run. Normally, this doesn't cause a problem, but if you changed the
color in midscreen, a la DLI, the next screen will begin with the color used
at the end of the previous screen. What might work: set up a DLI at the
very beginning of the screen, before anything is displayed, to change the
color. This will render the shadow register useless, but will prevent most
of the flickering associated with disk access. Sometimes, keypresses and
other interrupts can delay the DLI enough to cause a slight 'shiver' when
the DLI occurs a line or two late. This is normally not very noticeable.
Hope this helps...

does anyone know of a good C compiler for the 8bits? I have a few but
they all make p-code, not native 6502. There are: Ace C, Deep Blue C,
and C88 (i think). Those were too slow. I would like to port some
applications over to the atari.
I once began to write a compiler, but realized that it might not
be worthwhile for the time it would require. 10 years ago, it
would have been fantastic.

I would appreciate any help.....

Source record: 113744

.+..

I think I finally solved a dilemma I've had for some time, so I thought I'd share this; and also ask a question...

I've been using my 8-bit with disk drives for the past 8 or 9 years now. Years ago, I can't remember really ever finding a "bad" disk (can't format it), or writing something to disk only to find it unusable at a later time due to a bad sector. Over the past 2 years or so, I've come across several disks that I couldn't format (on ANY of my 4 1050's), and also found quite a few times where I'd create a file and then be unable to read it due to flawed sectors a few days later. Most of the disks I use fall into 1 of 2 categories : bulk no-name disks picked up at a computer fest, or IBM demo disks (I always fill out those cards for demo software, and then just re-format 'em for use on my 8-bit :-) I assumed my problems were due to my cheapy bulk/demo disks, or disks damaged during shipping for the demo disks.

Today I got 6 disks in the mail from an old friend. He sent me a bunch of AMP music files and other tidbits. I copied 'em over (with no problems), and then was gonna reformat and copy some stuff to send back to him. Here's where the problems began. 2 of the 6 couldn't be reformatted. Some would format in 1 drive, but not another. Some would format and let you copy files to them just fine...but then I'd get mega flawed sectors when trying to read them back. I ripped my system apart, swapped computers, reconfigured drives, swapped out cables, etc. to no avail.

...and then I noticed something. The disks he sent me were nice brand name disks, which was why I was gonna copy stuff back to his disks, rather than send it on my own cheapo disks. To be specific, they were 3M brand, double sided, *high* density (1.6 meg IBM) disks. So I grabbed a couple of my "bulk" disks. They formatted, copied and read just fine. Aha! I've found the source of much frustration! Those premium high-density disks do not work well with 1050 drives. I should have thought of this possibility long ago concerning problems with those demo disks...

But now I still am puzzled about something. My friend used these disks in his xf551, seemingly with no problems at all. My 1050's can *read* those disks created on the xf551 just fine. But my 1050's can NOT format or write to them in a reliable way. WHY?!?!

-Ray

This is a problem even in the IBM world! The particle size of
the magnetic thingies on the HD disks are smaller. It is just
not reliable to use one density in a drive meant for another.
Reading and writing is not completely reliable--stick with
double density! The XF551 uses a standard IBm mechanism (I
think) and they will work with HD disks (just don't try to
use a HD disk formatted double density and reformat it again
HD--tat is where the problems come from!) That is why the XF551
works. Its kinda complicated--so to keep it simple, use DD
disks in DD drives and HD disks for HD drives.
PS--Only IBm would create a beast this complicated! Things were
fine before the came along!

All you need to set up a Usenet site is a computer, compatible
software and a friendly site that is willing to feed news (and
possibly mail) to you. Software is available for most 16-bit personal
computers.

The difficulty of finding a feed site depends largely on where you
live, whether you're willing to make long-distance phone calls, and
whether you're willing to pay for the privilege of network access.
There is no fee for becoming part of Usenet, but some sites charge
fees for using their computer resources.

An alternative to operating your own Usenet site is obtaining a user
account on a public-access Usenet site. There are many public-access
sites on the network, some of which charge a fee. The Portal System
is one such site.

Some Citadel BBSes have been carrying Usenet newsgroups on a
read-only basis for a couple of years. Allowing the posting of
messages is a fairly recent experiment.

JACS_NJ is one of several Citadel sites that are receiving this
Usenet newsgroup courtesy of MAST, a BBS that serves as a
UUCP<->Citadel gateway. It is operated under sponsorship of the
Minnesota Atari ST user group.

Does anyone have the documentation to this amazing piece of 8bit software programming? My friend just unloaded his cache of 8bit stuff on me and he has the original disk and the command summary but no manual. No, this is not pirated, I just want to play the game. If no one has any manuals could you at least answer a couple questions?

- How do you capture the flag in the flag capture game? I must have killed the guardian 5 times and he's still there!

- What are you supposed to do against 'The Horde'?

- How is the computer opponent chosen. The computer seems to get tougher and tougher but who knows?

- What to the characteristics affect. More precisely what affects the speed at which your weapon reloads? I lost so many fights to a weaker opponent that can reload faster.

thanx for any help.

Try CC65. It compiles to 6502 (But not very efficiently), has a better standard library, supports unions and structs, and provides for in-line assembly. It does not directly support floating point or hardly any of the Atari hardware features. It is available via FTP to atari.archive.umich.edu at directory atari/8bit/cc65.

I have found some bugs in the compiler, the linker and the standard lib which I will post later. I have a set of floating-point routines for it (actually, C interfaces to the ROM fp routines) that I hope to give out soon.

You should keep an eye out for the rumored "TC8" C CARTRIDGE that may be out soon from DataQue; it is said to be full ANSI-C but we'll see.

I was _very_ pleasantly surprised to see the ad for ChromaCAD in Atari Interface. From the ad (although ads are never noted for their accuracy), this program looks really incredible, given the limited resources of the 8bits. I would _really_ like to hear from anyone who has used this package.

Also , I would like to know about the 3-d glasses that are mentioned in the ad. Are they LCD, or some cheesy thing?

Any info appreciated,
Steven Ourada

4353. Test

4354. Finally, A Dataque Product Release

Newsgroup: comp.sys.atari.8bit
Date: 1991-09-05 05:12:20 UTC
From: parsons@matt.ksu.ksu.edu
Message-ID: <kcbf5kINNo70@matt.ksu.ksu.edu>
Source record: 113656

Well, this is my 4th attempt in as many days to post this thing.
I really hope it finally works. My test went through, I think, so
let's hope. There are a few interesting products listed here; it
might be worth your time to browse it.

DISCLAIMER: I am not affiliated with Dataque, so don't mail
me with questions. Dataque can be reached at the
addresses below.

From: DataQue Software GEnie: DataQue.1 (Daily)
Post Office Box 134 Compuserve: 71777,3223 (Weekly)
Ontario, OH 44862 DELPHI: DataQue (Daily)

Subj: Product Information Release #91.06.02 June 1991

There are several new products in this release, some of which are
still in development. They are listed here, mainly to let you know
that there ARE products still available for the Atari Classic
computers.

Starting with this release, a simplified pricing structure has been
implemented. All prices are shown in US Dollars, for end user
purchases. See company policy at the end of this file for more
information on the ordering procedures.

PLEASE NOTE: Include shipping as outlined in the company policy
section at the end of this release.

We would appreciate your input on some of the following potential
future products. If you have any suggestions, comments, or
critisisms please write! If you have an ideal for a potential
product, either software, or hardware, we would like to hear from
you!

* MIDICART: A MIDI interface and software all on one plug in cartridge
for the Atari 8-bit systems.

* AGDAGON: A multi-computer/multi-player (up to 16 systems) game which
puts you against the crowd in a first-person perspective maze. An
inexpensive interface (GameLink-II) makes it possible. Only one
cartridge is needed for each loop to keep costs WAY down! Other games
are planned if AGDAGON is accepted. Estimate the cartrige to be $20
or less!

* 130XEC: An Atari 130XE computer on a PC card! This will allow you to have all the fun and utility of an 8-bit system hidden in your PC. Using a special MSDOS interface, your 8-bit applications can use the PC video and other peripherals, in addition to normal 8-bit devices. It may even be possible to be run an 8-bit process as a task using Windows 3.0! The 'XEC' will be designed with a high degree of compatibility with the original XL/XE line.

* 1600XLE: The Ultimate 8-bit machine... with a blazing 'no wait state' 8MHz 65C816 processor on a 'baby AT' sized motherboard, nothing will come close to the performance of this machine. A custom interface chip will allow PC interface cards to be used on the 8-slot backplane. This motherboard will fit into most PC style cases, and will run Atari 8-bit applications which make no illegal entry points into the OS, or use direct screen access. This monster would be for the power users only, not the casual game player!

TransKey: Version 2.4

TransKey is an adapter board for 400/800/XL/XE computers which will allow you to use an IBM type keyboard in those systems.
There are several variations depending on connector options.

TransKey solder-in version 2.4 ..... $47.00
TransKey plug-in version 2.4 ..... $57.00
Zero-Power SRAM option (adder to above) $12.95

Upgrade ROM 2.4 from any prior $5.00
6116 SRAM (if your board lacks one) $5.00

Please Specify whether you want the keyboard connector to be of the inline or chassis mount type. If not specified the inline type will be assumed. If you have an XE type computer, or an XL which has its PoKey IC soldered in, you will probably want the solder in version, to eliminate the need to remove PoKey and add an IC socket.

Turbo-816: Version 1.5 (Turbo-OS Version 1.311)

The Turbo-816x is a 16-bit CPU upgrade for the Atari XL/XE computer. This upgrade will add 16-bit working registers, a 24-bit address bus, and numerous new addressing modes and instructions. All this new power is available to new programs written to take advantage of the new CPU, while maximum compatibility with current hardware, and software is maintained.

Included with the Turbo-816x is a new operating system PROM, which can be installed to replace your current Atari OS, or using a switch circuit, used in addition to the Atari OS. This OS chip, called the Turbo-OS provides system calls to take advantage of the new processor addressing.

The Turbo-816x is clocked at the same speed as the original Atari CPU, so that current games and such will run at approximately the same speed as with the stock CPU. Since the OS, Interrupts, and Floating Point package are more efficient than the stock OS, existing applications will realize a speed increase of 5-10% in addition to an increase that is proportional to their OS system call usage.

The Turbo-816x comes packaged with the following:
- Turbo-816 adapter board for the XL/XE computer systems.
- Turbo-OS Operating System 28-pin PROM (2 for 1200XL).
- CPU ribbon cable with connectors.
- Installation guide.

Included also are the following files on SSSD disk:
Turbo-816 expansion bus pinout.
Turbo-816 MAC/65 compatible macros for 65816 instructions.
Turbo-OS MAC/65 compatible include file.
Turbo-OS to Atari 400/800/XL/XE OS cross-ref guide.
Turbo-OS function call application information.
Turbo-OS memory map guide, menu features, and several example files.

T816X-K Turbo-816 Kit Cost $100.00

Turbo-816 for the XL/XE computers. Includes adapter board, connection cable, Turbo-OS PROM, installation and usage guide, programming information diskettes. Please indicate which system (600xl, 800xl, 130xe, or 65xe). To make room for added features the international character set, and cassette device handler have been removed from all versions of the Turbo-OS. Installing the Dual-Prom option will allow use of the Atari OS in applications where those features are desired.

T816X12-K Turbo-816 for 1200XL Cost $120.00

Same as XL/XE kit, except includes two PROMs for the 1200XL. Note: 1200XL function keys and lights are not supported.

T816IND Installation w/Dual Prom Option Cost $45.00
T816I12D1 Installation into 1200XL (w/800XL Atari OS) Cost $70.00
T816I12D2 Installation into 1200XL (w/1200XL Atari OS) Cost $65.00

Includes installation of a Turbo-816 into an Atari 8-bit computer. Units will be tested before the installation, and will not be modified if the unit does not pass all tests. Price includes any needed sockets, wire and toggle switch. Installations usually have a three to four day turn-around except 1200XL I12D1, which may take longer. Please provide name, address, phone number AND sufficient return postage.

TOS08 Turbo-OS PROM $12.00 Upgrade OS to 1.311
TOS08UG Turbo-OS PROM $22.00 Upgrade OS, and T816 board to 1.5

Upgrade/replacement Turbo-OS PROM of the current version for the
600XL, 800XL, 130XE, 65XE or single PROM 1200XL. Use 'UG' suffix
for upgrading T816 and OS to current version. You must return your
T816 board for board upgrades.

PROGRAMMER'S PAL: Version 1.0

This program allows BASIC programmers to have reference data close
by while they are programming. This version is designed for AtariDOS
2.x and compatibles. Among the functions included are:

Muliple CROSS-REFERENCE, BASIC CURRENT STATUS, CALCULATOR, DISK SECTOR
LOADER, MEMORY PEEKER, and OPERATING SYSTEM EQUATE.

PRG-PAL1 Programmer's PAL Cost $20.00

Turbo-SRAM/PROM: Version 1.01

These boards will hold two memory devices. Supported types are
62256 (32k SRAM), 66204 (128k SRAM), 27256 (32k EPROM), 27512 (64k
EPROM), and 27010 (128k EPROM). Information to configure the card
for other devices is supplied. Both devices should be the same
size, although you may have one SRAM device, and one PROM device.

Turbo-SRAM boards include a shunt selection guide, connection cable,
protection sheath, and memory as specified by the part number suffix.
The cable included will support one memory card. Turbo-SRAM is
available without any installed RAM, 64k or SRAM, or 128k of SRAM.

TSRAM-0 0k Turbo-SRAM Cost $35.00
TSRAM-64 64k Turbo-SRAM Cost $50.00
TSRAM-128 128k Turbo-SRAM Cost $70.00
TSRAM-256 256k Turbo-SRAM Cost $99.00

Turbo-Calc: Version 1.01

Turbo-Calc is a cartridged based spreadsheet program for the Atari
800/XL/XE/XEGS/T816 systems. It will work with, or without a
Turbo-816 installed. The Turbo-816 is required to allow access to
expanded RAM. Turbo-Calc supports up to 104 columns and 99 rows of
information.

Source code for Turbo-Calc is also available seperately, Please
specify either MS-DOS, or Atari DOS disk format, and whether you want
5.25" or 3.5" floppies. The Turbo-View environment is not included
in this source code package (see Turbo-View).

T816-S16 Turbo-Calc Cost $30.00

Turbo-View: Version 1.02

Turbo-View is a graphical operating environment, which uses the graphics 0 (antic 2) mode. The source code supplied contains the windowing routines, and execution control algorithms. Supplied also is the Turbo-View module of the Turbo-Calc program, to show an actual example of its use. Purchase of source allows use in non-commercial programs.

T816-S16S Turbo-Calc Source Code Listing (w/o Turbo-View) Cost $20.00
T816-V16S Turbo-View source code (non-commercial use) Cost $30.00

Turbo-A8: Version 1.2

This is an assembler which will run on any 8-bit Atari computer, and generate either 6502, or 65816 object code. There is also an extended version for systems which have XE banked type upgrades. This was written by Jeff Williams of Canada, and coined as the Alf Assembler.

T816-A8 Alf-Assembler for 6502/65816 Cost $20.00

TC8 *** availability to be announced ***

This is the high level language system you have been waiting for. The C language is THE most popular language on large systems, and now you can also develop complex programs using C, without paying the severe code size, and speed penalties that 'other' high level languages for the Atari 8-bit have demanded.

TC8 will be distributed on a bank selected cartridge, to allow the features of the ANSI C language. Not a small subset, but the real thing. A full function library will also included on disk, to allow users to make changes to system functions. Library source will be offered seperately.

Currently the runtime libraries are 90% finished, and the cross-compiler version is done except structure and union support. If you are interested in this product, please send me a post card with your thoughts!

TC8DC Turbo-C8 Developer Cartridge ** ESTIMATED ** Cost $55.00

*** Specifications and prices listed are projected and are subject to change. Final specifications will be released when the product is available. This is projected to be available 3Q '91.

TBC-4000 *** availability to be announced ***

The TBC-4000 is a bank selected cartridge for all Atari 8-bit computer systems. Many users have requested the availability of an

easy to use banked cartridge, and here it is!

The TBC-4000 has a socket for one JEDEC memory device. This can be any EPROM from 2764 (8K byte) through 274000 (512K byte). There is an option socket for an 8-pin EEPROM (Electrically Eraseable EPROM). This can be used to store user programmed defaults. There are several of these EEPROMS available, from 256 bits, through 4K bits.

To simplify programming, the TBC-4000 forces bank-0 into the upper half of the cartridge (4K bytes) at all times. This removes the hassle of recalculating the cartridge checksum on the XL/XE's each time the bank is changed. Also, bank-0 will always be the bank entered through the OS system reset/init, so you do not have to duplicate that code in each bank. Since this bank is always accessible, your bank switching and other often used subroutines can be located here for optimum performance. The lower 4K of the cartridge will power up randomly, so your bank-0 init code will have to initialize the select register.

The price below does NOT include any EPROM or EEPROM memory device, and is for low volume (under 25) purchases. This estimated cost is probably a bit on the high side and will be adjusted when I have actual boards.

TBC-4000 Banked Program Cartrige ** ESTIMATED COST UNDER $17.00

*** Specifications and prices listed are projected and are subject to change. Final specifications will be released when the product is available. This is projected to be available 3Q '91.

MSDOS Cross-Development Products for the Atari 8-bit Systems:

The following products are available for those programmers which have access to a IBM/PC or compatible computer, and would like to be able to develop code for their Atari 8-bit (and Turbo-816) systems.

These programs require a minimum of 256K of available RAM, and either MSDOS or PCDOS, version 3.0 or higher. They will all work on 8088 through 80386 based machines. A hard drive is recommended.

The X816 assembler will produce code in either binary image (for EPROMS) or Atari binary load format. Extended Turbo-816 object format is also supported for images which are to be loaded above the normal 6502 addressing range. Version of 1.17 is current.

X816 cross-assembler for 6502/65816 Cost $20.00

D816 will accept either of the two binary forms for input, in addition it will accept the link file produced by X816 (or you can construct your own with a text editor) to add symbols to the disassembly. Version 1.04 is current.

D816 cross-disassembler for 6502/65816 Cost $15.00

The TT utility will convert Ascii, and Atascii files from one format
to another with several options. Version 1.04 is current.

TT text-translator Cost $10.00

H2B and B2H are used to transfer binary images in an ascii form, and
convert them back to binary images. Many EPROM programmers use one
of the supported hex formats. Current version is 1.03 of each.

B2H binary to intel/motorola hex and...
H2B intel/mot hex to binary translators Cost $10.00

A disk with all of the above (most recent versions of each) is
available for $32.00 on 5.25" MSDOS diskettes. If you would prefer a
3.5" diskette, please indicate such, and enclose an extra $2.00 per
diskette.

POLICY:

We accept personal checks, Money Orders, or cashier's checks made out
to DataQue Software. Personal checks must clear before shipment is
made. If you would prefer a COD delivery, include $5.00 for special
handling. Shipments are shipped via parcel post unless special
handling is noted. Foreign orders must be a money order drawn on a
US bank, in US funds, and require an additional $5.00 added to the
total amount. Any taxes are the responsibility of the purchaser.
All orders should include $4.00 to cover shipping and handling,
except for installations, which should include return postage. All
prices are in US dollars and are subject to change without notice.

DataQue warrants its products for 1 year on parts (hardware and
media), and 90 days on labor. Shipping to DataQue Software is the
responsibility of the customer, and return postage is payed by
DataQue. Please include a complete description of the problem, and a
phone number in case we need to contact you.

4355. ChromaCAD

Newsgroup: comp.sys.atari.8bit
Date: 1991-09-05 14:14:07 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9109051414.AA25629@smithkline.com>
Source record: 113754

In IA8 V91 #65 Steve Ourada noted an ad he saw for ChromaCAD.
ChromaCAD is a brand-new issue of commercial-grade software for the Atari 8-bit by Marv Seaman of Palette Imaging. It is actually two separate programs costing $29.95 each. Prog #1 is the outline drawing module, works on XL/XE machines. Prog #2 is the 3-D shader module, for XE only.

I have a sample Review copy in hand of both programs. The manuals are beautifully written. When I first received the thing I thought there was some mistake, it looked like manuals for $500 Mac programs.

The Shader module at present won't run on RAMBO'ed XL's, as it uses ANTIC mode for displaying on-screen models. However, following a phone call to Palette about this, it now appears a 2nd version is in the works (will probably be included on the flip side of the disk) that will run extra RAM from CPU mode & thus be RAMBO-compatible tho with some slight loss of program flexibility. Also, the main program itself is being upgraded & is in the mail to me at this moment. The upgrades are minor. The same ad that appeared in AIM will also appear in the Sept issue of Current Notes. I will mentioning ChromaCAD in my October "Alchemist" column. And with a little luck, if all goes well, we might see a review of ChromaCAD in the DEcember issue of CN.

Palette also has under development (almost finished) a utility package to accompany ChromaCAD which includes an Epson-compatible screen dump for proofing your creations. The orimginal has no print facilities, you have to send your final image to Palette & they print it for you on a hi-res color laser thing.

This is probably the most sophisticated graphics package ever written for the Atari 8-bits. Every single byte of 130XE memory is used.

A pair of 3-D glasses does accompany the package. Sorry, they're the cheapie kind, cardboard, like in the movies.

4356. HD DISKS & THE XF551

Newsgroup: comp.sys.atari.8bit
Date: 1991-09-05 14:53:54 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9109051453.AA25685@smithkline.com>
Source record: 113659

I noticed the two messages in IA8 V.91 #65 5 SEP 91 regarding HD disks. The advice given by Kevin White is correct. Particle size on HD disks is smaller than standard DD disks. Because of this, each particle is a weaker "magnet", so the write signal imparted to the disk must be stronger to obtain the same degree of magnetization.

The mech in the XF551 is indeed a standard IBM-type. The heads & electronics do deliver the extra magnetization bias to format/write on HD media. Therefore, a 1050 will read such disks with no problem. But a 1050 won't write to HD because the heads are desgined to deliver a bias to media that is more easily magnetized than HD.

I'm planning a series of articles on disk drives in my "Alchemist" column beginning early 1992, starting with "Secrets of the 1050". This is one of the subjects I had intended to address.

The XF551 is in short supply. I have purchased several new & used ones over the past year from Toad Computers. $149 used, $175 new. This is for R. Harrie who posted a message indicating a desperate need for an XF551.

If anyone knows of a source for the 8040/8050 CPU in the XF551, let me know?

I will pay $50, plus postage, for a dead XF551. Contact me as follows:

Message-ID: <1991Sep5.214909.4290@usenet.ins.cwru.edu>
Source record: 113660

I'm working on a quick upgrade--should be done in a week or so.
Then I'll do whatever I can to get it to the archives or post
it here (it is a 20,000 byte arc BEFORE UUEncoding--I dn't know
if that is desired here!)
Hold on for more info....
Kev

4358. Program for IBM to read Atari disks (was NONE)

Newsgroup: comp.sys.atari.8bit
Date: 1991-09-07 04:02:41 UTC
From: ar630@cleveland.Freenet.Edu
Message-ID: <1991Sep7.040241.26291@usenet.ins.cwru.edu>
Source record: 113662

OK, the update is done. I'm trying to get it to here (It's
difficult because the only PC I use normally with a modem is my
Atari, and ATARIO is an IBM program, and it doesn't copy files
TO an Atari disk. Kinda stinks, huh?) Anyway, I have a plan,
and soon should be able to. The question is, do you want it
here? Like I said, it is a ARC, over 20,000 bytes BEFORE
UUEncoding. It would probably have to be posted in parts. If
not, somebody help me get it to te archives. (I don't have FTP
access.)
See you soon with more!

4359. ANSITERM 0.2 available...

Newsgroup: comp.sys.atari.8bit
Date: 1991-09-07 19:20:13 UTC
From: sourada@iastate.edu
Message-ID: <sourada.684271213@vincent1.iastate.edu>
Source record: 113663

What follows is an excerpt from a message from Bob Sinclair to me. He has asked that I forward the info to the comp.sys.atari.8bit group because he has no Usenet access. I have just grabbed the relevant portions from the message for accuracy...

An .ARC of version 0.2 of my ANSI emulator for the 8-bit (called ANSITERM) is now available for download on the FROG ATARI BBS in St. Louis, 314-776-0321.

Although higher baud rates are allowed, version 0.2 will still have problems above 1200 baud. Bear with me. Improvements in speed and in the ANSI emulation itself are top priority for version 0.3. I hope version 1.0 will come after that. (P.S. You need an ATARI 8-bit with 48K, 1 disk drive, and a HAYES compatible modem. Other modems might work, but may ignore some menu functions. ANSITERM works with the 850, PR, MIO, SX212 in direct connect, and 1030 or 835 modems. DOCs are included in the ARC file.)

Atario does not copy to an Atari disk. It never did. There is a program
out there called UTIL.EXE, by Charles Marselett (spelling?) that will,
but not DS/DD, and it always translates atari characters when writing.

Um, if you DO have a version of Atario that copies TO an Atari disk, I
would be interested in any info about it. Please nake sure you have te
same program I am working with. Once loaded, it presents a full-screen
menu. The UTIL program gets its arguements from the command line.
Which are you working with?

With the UTIL.EXE program, you can specify a /B option in the command-line
that will turn off the translation. Also, has anyone encounterd problems
copying files from the IBM to the Atari disk using UTIL.EXE. The reason
I ask is I keep getting an "Invalid path for <<(null)>>" error when trying
to write to the Atari format disk. I'm using a 1.2 meg floppy to write
to the disk, and I think that is the problem. Also maybe I'm not
specifying the correct arguments, I type "util /w a: file.name"
which the computer responds with disk writing and then the error message.
Any suggestions would be appreciated.

4366. CC65 "if (globalvar)" bug

Newsgroup: comp.sys.atari.8bit
Date: 1991-09-09 22:11:58 UTC
From: tribe@jed.cs.uidaho.edu
Message-ID: <1991Sep09.221158.14231@groucho>
Source record: 113670

PROBLEM:

The CC65 C compiler has a bug in its "if" statement. The code

```
int globalvar, x;

func()
{
x = -1;
if (globalvar) x = 0;
}
```

will not behave as expected because globalvar will be improperly evaluated.
this code fragment compiles to (roughly; my Atari is still in packing from
the summer...)

```
; (func preamble...)
ldax #-1
stax _x
lda _globalvar
ora _globalvar+1
jsr tstax
lbne L123
ldax #0
stax _x
L123:
; (func wrap up...)
```

The compiler cleverly evaluates the non-zeroness of globalvar by bit ORing
the two bytes together in the accumulator (A). But it compares A AND X,
ignoring the fact that the X register has a random value left over from the
previous expression. The bug will only show up if the previous expression
was not in the range 0...255 (i.e. X register != 0). This also only occurs
for tests of global variables and only tested in this manner.

SOLUTIONS:

Evaluate non-zero of a global variable by:

1) if (globalvar == 0)

```
2) #asm
ldx #0 ; clear the X register
#endasm
if (globalvar)
```

The latter is more efficient but a bit clumsy.

DISCLAIMER:

I may not have the latest CC65 version. Your compiler may vary.

If your site is running Unix or a relative, you probably have a ``uudecode''
program available. If not, there is compatible software for the ST and
PC -- I don't know if it is available for the 8-bit.

The algorithm is not complicated. Basically it considers the three bytes
as a unit, and spreads the bits out across four bytes so that the result
is always a printable character. Then the data is organized into lines,
of which the first character encodes the line length. The line may or
may not be terminated by a sequence-checking character, depending on
the software used to create the uuencoded file. Some variants of uuencode
place a translation table at the top of the file to help avoid damage
created by bad EBCDIC/ASCII translation tables. Some also provide for
the automatic splitting/reassembly of long file via an ``include''
directive.

If you have access to an ST, I recommend UUCODER (shameless plug).

Sorry, the program you refer to as UTIL.EXE _is_ the same program that's also known as ATARIO. _I_ gave it the name "UTIL" before I knew it had a name of its own, namely "ATARIO," when _I_ posted it to this Net and submitted it to the archive. And I repeat, it DOES read AND WRITE Atari double-density diskettes, "with" and "without" ASCII-ATASCII translation etc.

Now, having said that -- is it possible we're talking about two different programs here? The one I call ATARIO (and originally misnamed UTIL) is the one I'm thinking of and talking about. What ATARIO program are YOU talking about? Who wrote it, when, and where'd it come from?

As a result of input from Robert Anisko, Kevin White and others, I was able to get my hands on three versions of programs that can read Atari 800 diskettes on the drives in XT/AT class MS/DOS systems.
From Bob Puff's BBS, at (716) 247-8355, I got ATARIIBM.ZIP. That has source in "C" and assembly.
From the PartTime BBS, at (216) 582-1196, I got AT2IBM.ARC. That has source in Turbo Pascal and is a result of minor modifications to the source available in ATARIO.ARC. These modifications were made by Kevin White.
From the JACS BBS, at (609) 346-1224, I got ATARIO.ARC. This is apparently the grand-daddy of this kind of program. Source is Turbo Pascal.
Once again, thanks to all the people that assisted me in tracking down these files.

Talk about confusing! OK--here goes:

As far as I'm concerned, the names of thse programs are those that you type
to run them. Therefore, the one that gets command-line arguements is UTIL,
and the one with the menu is Atario.

I got copies of both of these programs off of CI$, under completely
different ARC names. I have no idea what their real names are, that is why
I use the filename rule.

UTIL (what I call UTIL) gets command-line arguements. It is written in C
and 8088 assembler. The source code was included with the ARC. The C
part was called UTIL.C. The ASM part was called ATARIO.ASM. Confusing! I
would have liked to modifiy this one for DS/DD use, but the important part
(the part that needed modification) was in assembler and, alas, tat is
where my knowledge ends. So, I lef it alone. It is a good program,
though, written by an author who has moved on to immensly bigger and better
things (I have seen him hanging around, like I do, on Comart on CI$,
discussing fractals.)

ATARIO (what I call ATARIO) produces an on-screen menu when it is run. It
is written in Turbo Pascal, which I know very well. I modified it to work
DS/DD with XF551 disks, made it more colorful, and made it delete
incomplete files on the PC's disks (per request of THE Bob Puff, again from
CI$). That program is posted here, on comp.sys.atari.8bit, a couple of
posts back. I have gotten it off of the newsgroup, so I know the post is
OK. I would like somebody to place it in the archives, as I don't have
FTP.

Well, thats it. Any questions?

Kev

Atari DOS 2.5 cannot handle true double density (256 byte sectors). You should be able to get 2.0s from your local Atari user group or BBS. Many public domain disks come with DOS 2.0S. Mydos will also work, if you have that.

i) you are trying to read/write Atari disks on an IBM PC. Don't know anything about this. BUT:
ii) you are trying to read/write IBM disks on an Atari. You cannot do this with Atari DOS. You will need a program that comes with the Happy Enhancement, IBMXFR. This program actually reprograms the 1050. It "teaches" (***) it four extra commands to read an IBM sector, write an IBM sector, switch to IBM mode and switch to Atari mode. IBMXFR works fairly well to convert Atari format to IBM format and vice versa. Remember to format an IBM disk on an IBM computer, since IBMXFR cannot format a disk...
(***) Tech info: IBMXFR sends about 200 bytes of 6502 code to the 1050, adding the new commands I,J,K and L to the commands the 1050 already knows (like r for read, R for high speed read etc). I could look up the details for you, I dissassembled IBMXFR about two years ago when I decided to hook my 1050 up to my Macintosh... I even wrote a filing system for MSDOS on my Mac. I deciphered the MSDOS shit because I wanted to transfer *from* MSDOS, but I refused to implement the stuff to write MSDOS format... yuck...

>Atari DOS 2.5 cannot handle true double density (256 byte sectors). You
>should be able to get 2.0s from your local Atari user group or BBS. Many

IBM sectors are 512 bytes. I doubt Atari DOS can handle that... And as far as I can recall, IBMXFR works fine with any version of Atari DOS.
Disclaimer: I haven't used it for years...
But I do recall my 1050 having problems switching from IBM mode to Atari mode and back... I would get the typical Atari "there is something wrong on the SIO bus" sound (fart-like sound :-)) but that could also indicate bad SIO cables... If this is your problem, trying to switch from Atari to IBM mode and back a couple of times should finally work (just bear the horrible sound ;-))
Hope this helps,
Ciao!
Michel

4384. VT850 uploaded to atari.archive

From: AKH104@psuvm.psu.edu
Message-ID: <91260.140956AKH104@psuvm.psu.edu>
Source record: 113689

I have a ICD US doubler for a 1050 and a Duplicator for my other 1050
running version 5.0 with the new rom upgrade.
Why is it that Ultra Speed sector scewing on the Duplicator drive is slower
that the Doubler drive? That is..If I format Ultra on the doubler..the
disk will boot in ultra speed on either drive....however if I format ultra
on the duplicator drive...neither drive boots them as fast as Ultra formated on
the doubler. The Duplicator is supposed to be ultra speed compatible..does
it not write the ultra speed scewing when formatting or does it write
a generic one..not exactly the same sequence as the doubler would write.
?????????
Anyone understand that?
Andrew. [AKH104@PSUVM.PSU.EDU]

Source record: 113695

Leo Hinds, IBM PC and clones are fixed speed drives. 360K 5 1/4" and 720K 3.5" floppies use 512 byte sectors. I believe 1.2 MByte 5 1/4" and 1.44 MByte floppies also use 512 byte sectors, but with more tracks and a different magnetic media to handle this. The Macintosh 400K and 800K are variable sped drives to get a little extra storage space. This carried over from the variable speed 5 1/4" drives used on the Apple II series. Atari ST/TT disk format is identical to the IBM 3.5" 720K format. In fact, Atari was using this disk format BEFORE IBM even used it. Data General was the first company to use this format. I don't know much about the Amiga disk format. I do know there is a program for the Amiga which allows you to format 720K pc format disks. The regular Amiga format is 880K. Mac 3.5" 1.44 MB is exactly the same as IBM 1.44MB, at least at the sector level. Of course the directory structure, etc is completely different. I hope this helps out.

Just responding to a number of interesting items in the IA8 Digest V.91 #69 (19 Sep 91).
Regarding the post inquiring about prices for the 1050 drive: first, you said you "need a new 1050"; be aware there is likely no such thing as a "new" 1050. Anything you buy these days is used. The going price for a used 1050 at fests these days is about $75 (including xfrmr & cable). Mailorder prices are higher, typically $100-$150. I have purchased "reconditioned" drives from B&C. Their use of the word "reconditioned" is so liberal as to constitute an untruth. Both drives I purchased from them (for $149 in 1989/1990) were decrepit- burnt parts on the boards, rotten belts, missing RF shields, various other atrocities. I also purchased one used 1050 for the outrageous sum of $179 from San Jose Computer, but it was top-notch, like new, even arrived in sealed plastic. If you buy at a fest you can get better prices, but you have to trust the person selling it, as there is usually no way to test the thing on site (well, you coul d at least plug it in & see if it initializes properly & the pwr lite comes on). I'll be addressing the topic of used 1050's in my column in a future issue of Current Notes (probably the Jan/Feb issue 1992, "Secrets of the 1050").
I'm still looking for used XF551's, preferably dead/basket case, will pay $45 for a basket case or $90 if it runs.
Hello Colin Hunt, welcome to Info-Atari8. I received your correspondence. Sorry I'll miss you at this year's WAACE Fest. If you are still looking for a 5200, check my "Alchemist" column in the Sep 1990 issue of Current Notes. All Electronics in California is still selling dead 5200's for $7.50 each. They wer e still offering them in their most recent catalog. I bought 3 or 4, use them for spare parts (5200 OS is same as for XL, contains same custom chip set as in the XL). The junkers don't work & don't come with xfrmr or controller. Brand new controllers are available, I'll be giving a source in the Nov issue of CN.
RE: the posting by Andrew on 1050 Duplicator, Current Notes published a highly critical review of that upgrade several years ago. Duplicating Technol- ogies has since gone belly up. The general opinion of the Duplicator is that it never delivered as promised, never really worked, the word "hoax" comes to mind. This despite impressive ads in ANALOG & ANTIC a few years back. I'll give the exact reference for the CN article if anyone expresses interest.

Ive been having a problem with using the bobterm XEP80 module with a commie
64 monitor I just inherited.. It seems that the topmost and bottommost lines
are not on the screen! I cannot see them..
previously my monochrome monitor had no trouble displaying this..
Does anyone have any ideas about what I can do to get it to work right?

4395. Happy IBM reader n' ATR8000

Newsgroup: comp.sys.atari.8bit
Date: 1991-09-20 17:52:10 UTC
From: alj@bilver.uucp
Message-ID: <1991Sep20.175210.8139@bilver.uucp>
Source record: 113700

Thank you to everyone who suggested hard drives for my Atari 800. The ATR8000 sounds like the best bet, since it will control the hard drive and a floppy if my old one dies. Can anyone suggest a mail-order company or magazine that will help guide me to places that sell these items? Thanks!
I caught a drift of a message that mentioned that Happy sells (sold?) a controller to allow Atari drives to read IBM disks. I would be very interested in buying such a product, as it would allow me to transfer files between my computer systems. Check this out for twisted file transferring - I have an internal modem on my Amiga 3000. I can write an IBM 3 1/2" disk from my Amiga. This I can take to my IBM and copy it to a 5 1/4" in disk. Finally, this disk could go to the Atari and be read. Kind of convulted, but it would work. A null-modem cable would also, but I think this method would be a bit more flexible (and fun!). :)
Any help would be appreciated. Anyone know if CrystalWare (Fantasyland 2041 AD, The Crypt, Forgotten Island, Quest For Power, etc.) is still in existence? Great pre-Ultima games and in BASIC!

I got the following info from Cuurent Notes magazine, and thought
I'd pass it along...

Atari Corp. is sponsoring the Chicago Atarifest November 23-24 at
the Ramada O'Hare in Chicago (near the airport). At this fest,
2,000 square feet of space has been reserved for 8-bit products.
Atari will be emptying out their warehouses of all remaining 8-bit
products. This is the last 8-bit support that you'll ever see from
Atari...who knows what sort of treasures may be uncovered...

for info, contact Mike Brown at LCACE user group:
M.BROWN56 (on GEnie)
or write
Chicago Computerfest by Atari c/o LCACE
Box 8788
Waukegan IL 60079-8788

4401. Atari 8-bit emulators

Newsgroup: comp.sys.atari.8bit
Date: 1991-09-24 19:48:01 UTC
From: rbhardin@descartes.waterloo.edu
Message-ID: <1991Sep24.194801.15177@descartes.waterloo.edu>
Source record: 113703
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st.tech

Are there any Atari 8-bit emulators available for the ST? I'm considering writing one for [the other 68K-based home computer], and I'm interested in any perspectives I might find here. In particular, I'm concerned about ways of emulating the custom chips (display list interrupts, sound, etc.)

As far as I know, there are no Atari emulators for [the other 68K-based home computer], except for gag ST emulators. That's why I came here. I figure those who remained faithful to Atari might have pressed for an 8-bit emulator.

Thanks, peoples.

4402. 5200 JUNKERS

Newsgroup: comp.sys.atari.8bit
Date: 1991-09-24 21:06:14 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9109242106.AA01062@smithkline.com>
Source record: 113606

OK yooz guys,
Looks like there's some characters out there who want to pick up some
Atari 8-bit junk.
Before I give out the goodies, I gotta give ya the *PITCH* :

If you guys subscribed to CURRENT NOTES, you wouldn't have to beg this info
from me on the Net. Sheesh, I published this a year ago in my Alchemist column.
If you received CN every month you would get all the goodies without having to
ask/beg like this, it's pathetic. So, SUBSCRIBE!!

Now, here's the dope:
Junker 5200 games machines are available from All Electronics P.O. Box 567
Van Nuys CA 91408-0567 order line 800-826-5432. The 5200 junkers are described
as "Experimenter's Delight" cat. # A-5200 $7.50 each or 2/$13.50. They come
sans power supply, game controller, or software. They are absolutely guaranteed
not to work (my four were 100% defective). The power supply is I think, the
same transformer used for the 1050 disk drive or 850 interface, not totally
certain of that. The board contains 4 of the 5 LSI chips used in the 800XL:
GTIA, ANTIC, POKEY, SALLY (no PIA), plus 16K DRAMs & the usual assoertment of
electronic doodads. LSI chips all socketed, easy to remove, all mine worked
fine in my 800XL. Call All Electronics customer info at 818-904-0524 if you
have other questions.
You can get the game controllers from Alltronics 2300 Zanker Road San Jose
CA 95131 phone 408-943-9773. These are brand new in boxes, $12.95 includes a
trakball plus two controllers. Don't know any deatails, I didn't buy one.

I have decided to abandon my Commodore(hissss) system and use thi
s 65XE and 1050 for $50.
I have ordered the SX-212 from Damark for $19. I have been told i
t does not include either an SIO cable or a term program.
Here is where all you fellow users come in.
I want you to tell me which term is the best, and where I can get
it.
I used to have a 1200XL, but I only used it with those lame game
cartridges. I later got an XEGS and used it with the better XE ca
rts. I have never done anything serious with an Atari like I have
with my Commodore, and I need some help starting all over again.
What are the prices on the old 1020 plotters these days?
I got one from CMO in late '89 for $9.99 new. It broke and I woul
d like to find another one.
Is San Jose computer still supporting the 8bits?

Thanks.

I have an Atari 800 with a disk drive and an Atari printer. I
also have a cassette drive and the hard to find parallel interface..

It comes with the BASIC cartridge and the Donkey Kong game cartridge

The thing is in BRAND NEW condition, and works great!! I also have
TONS of manuals for it... It will make a great learning computer for your
kids or something...

Asking for $125 plus shipping & handling but price is negotiable...

I also have am Apple][+ with 48k that is also in BRAND new condition.
It's perfectly clean and works great. Comes with drive controller and
one 5.25 disk drive... Asking $100 plus shipping and handling for but
price is negiotable...

George

You folks were talking about 8bits for sale a thrift stores?

My girlfriend and I went into a thrift store and found the following in one large box.

130xe (320k)
Indus Gt Drive
xm301 modem
4 Joysticks
All power supplies
Over 200 Disks full of software, along with all original manuals.
Basic Xe cart w/docs
Sparta X Cart w/manual
Action Lang Cart w/manual
And more..

All for.....
$49.99

We bought it, to say the least!
It was nice to have an 8bit around again!

There is an 9-Bit Emulator for the Atari ST called Xformer 2.5. It is
pretty good, but not too fast. I think it was released into the public
domain, but I'm not sure about that so don't quote me. The only time I
saw it was at a User group meeting, and at the time it didn't do sound
(and wasn't version 2.5, so it may do it by now).

There is also a Commodore 64 Emulator, but I haven't seen or used it.

rbhadin@descartes.waterloo.
There are emulators for the ST. I currently have an apple][emulator, a C64 emulator, a Macintosh, IBM and 800 emulator also. About the 800 emulator, it's unbelieveably slow. I would like to see someone else design and make an 8-bit emulator, the ones I have were all done buy the same guy and are horrendous to use. it can't be that hard to emulate an 8-bit at full running speed,can it? Please go for it, I'd be very interested in seeing your end result!

Scott, how does the Apple II emulator for the ST work - I've heard about it, but thought it was never finished. I guess the 3.5 inch ST drive would have a pretty difficult time reading 5.25 inch, 140K Apple II formatted disk, huh. Do you actually own a Mac emulator? If so, which one (Magic Sac or Spectre or Aladdin)?

Don't... DON'T buy an SX-212. That has got to be the WORST modem I have ever used in my life... Invest in a 850 box or MIO and get a real modem (2400 baud at least) I had an sx, and i figure it's called the sx cause it SuXs... It makes so much noise that it drove me up the wall. Xmodem x-fers would take forever because it would have to retry blocks like 5-8 times before they went through.. Just want to save you
from going through the same thing

Jeff

Ever notice how loud the "negatives" are and how quiet the "positives" are?

I use an SX212 and it works 100% fine for me. I have done many uploads and downloads using it, under bobterm. I have had trouble with kermit, but I have no reason to believe it's the SX; I think it's due to the many hops in the path getting from the dial-in modem to the server, deep within the BBN internal LAN; if I accidentally type a long file, I can ^C to death and nothin's gonna stop the stream outside of hanging up. BTW I WISH I'd gotton mine for $20!!

At least try the modem before going suicidal.
:-) Stan

If you want to get a modem for an 8bit, then DO, DO, DO buy a sx212. At
$20 they are a steal. I'm going on my fourth year of using my sx212 and
have never had a problem. It dials both the # and *, which comes in
handy with LD codes and turning off call-waiting.

Mine was noisy too, until I opened it up and disconnected the speaker!

I have never had a problem with transfers, maybe you just have noisy
phone lines.

I am very happy with it, and it is a very good modem for 8bitters if you
don't want to buy an interface, which is the main reason I bought one,
because I already had a parallel port interface. (And boy does it fly
compared to my xm301 modem!!!!)

Well, There is an 8-bit emulator for the ST and is called Xformer...have not used in for quite awhile, but it did pretty good. A friend of mine also has an ST emulator for the Amiga..he says its pretty good, there are acouple of things the emulator has a hard time with...but did hear he can run a good amount of ST software...have not asked about the speed... should not be too bad being both systems use 68000's the emulator does not have to redirect CPU instructions from one type to another as you do from the 8-bit emulator to the ST...

Well on the subject of the SX212 being a bad modem... I dont believe that... it works great hooked up to both an MS-Dos system and my Atari 8-bit...never had any problems with it on the subject of noise or the part of having to resend info 5 or 6 times each block... I have had as much hard use out of the SX traveling between work and home... and it works just as well as my US Robotics Dual Standard... (except the sx is slower of course hahah) I have had the SX-212 since 2 months after its release... I feel it is a good modem... if you have the money, I do suggest you get a MIO and a 2400 ext. that way if you ever want to update to something better (speed or error correcting in the future) you have the ability... but if you are short on money, I would get an SX-212... hahah back when I bought it...I thought it was the best thing since microwave popcorn...hahaa... after bbsing at 300 baud for about 2 or so years before that...

I am thinking about purchasing a used Atari 800 and a disk drive.
Of course the price will be very reasonable (low low!). I have
a lot of computer experience (Apple 2, Mac, IBM) but have
never worked on an Atari 800 or 400 as my own machine.
I do know of the really great games the Atari 800/400 had though.
My question is: Is there a later model Atari that is compatible
with Atari 800 software that I should be aware of? I know
of the Atari ST which is not 8-bit (not even a 6502!). So
please fill me in on any 6502-based CPUs atari came out
with after the 800 that are backwards compatible. Also where
can I get catalog of all of the older Atari 8-bit HW and SW?
I would like to buy Frogger, etc.

Please reply via e-mail or post here!

Thanks,
Ron

-.,.-

Just wanted to throw in my 2 cents on the $19.95 SX-212 modem deal
from Damark. I'd say "go for it" if you're in the market for a 1200
baud modem. I've been using mine fairly heavily since I acquired it
back when they were first released ('86? '87?). I paid $75 (great
at the time) and have been mostly pleased with it. I say "mostly"
because it does have problems connecting at 300 baud. That annoyed
me slightly when I first got it because there still was one 300-baud-
only BBS in the area. For the past 3 years it doesn't matter though
becuase everything is 1200 baud (at least), and 1200baud connections
have been flawless with my SX212.

-Ray

Well, here's another side to that story:
I think the PR Connection is GREAT. I've used it for over 4 years
and never had a problem with it, even at 9600 baud. (I did have a problem
at 19.2 baud, but that may have been the cabling I was using...)

Well, I have ran a BBS since the modem came out, about three years if memory serves me correctly and have used it to run the BBS. I have never had a problem with noise nor a problem with the modem. Now, I have used it both direct connect and connected through the sio port.

I dont think that a modem is your problem, it is that either your term program, handler, sio cable, phone line cable, phone connection, connecting modem or something else had the toruble. Of course, I could be wrong and you had a fluky one. But all in all it is a much cheaper option then buying and interface and a modem. Like I said I have used one for 3 years with no trouble! I even used it with Oasis, wich is known to have troubles with this modem with NONE! Becuase I always research ways around the trouble, yours could have been overcome by re-orienting the modem and the computer/disk drives.

Well, the ATM command would have turned the speaker off! You dont have to
disconnect it, just use this command in Bobterm: Create a filw with a text
editer called MODEM.BTM (I thin thats what it is called, its in the docs)
and in the file put the fillowing line

ATM(CONTROL-M)(CONTROL-J)

This will turn the speaker off. Note: YOU MUST TERMINATE THE COMMAND
WITH A CONTROL-M and CONTROL-J conbination.

Yes. It is called STXformerII, and is available from atari.archive.umich.edu.
It is very complete, and you can build a cable to connect an 810 or 1050 to
your ST. Pretty neat!

Help Me! I just got S.A.M. (Software Automated Mouth) and Music Construction Set last week. My girlfriend was messing around with them and set them by a magnet and (you know the rest). Anyone have any idea on how I can get a backup? To my knowledge, both of these are out of production.

Also, I would like to get a cassette player for my Atari. I have some French language tapes from Atari I'd like to use again, but my old 1010 is totally shot beyond repair.

Thanks,

Chip Downs

The P: R: Connection works well IF the PRCONSYS handler is used (the one supplied on the disk which comes with the interface). If this handler is not used, there may be some sporadic problems with some terminal programs, such as Express. The handler may be appended to Express to allow for it to work properly.
Also, I know of two cases where a P: R: has not functioned properly on a BBS. The device has a tendency to 'go to sleep'. Even when the proper handler is used, this problem can persist. For this reason, I don't recommend the P:R: for a BBS. This problem could probably be corrected if an external power supply were added. Other than this problem, the interface works well.

Did I really confuse people on that one? I am running the 850 at 2400
baud, 8 BITS, NO parity. Question is this: CAN THE 850 DO 2400 baud
7 BITS 1 STOP BIT for connecting to IBM FVM/VMS Main Frame systems?????
THE MANUAL SAYS YOU CAN NO RUN THE 850 ABOVE 300 Baud with this setting.
Sparta Dos's PORT command sets XIO 36 and XIO 38 Respectivly. However
using this or basic XIO commands with values of XIO #1,28,?,"R1:"...
XIO #1,90,?,"R1:" the screen goes black and locks up...system reset works
but any time those commands are sent the the 850 it stops.!!!
So, again....how does one to E-7-1 at anything above 300 on the 850?

Source record: 113642

In article <1991Sep30.121704.18846@umesve.maine.edu>,
deej@thrush.umesve.maine.edu (Dj Merrill) says:
>
>In a nutshell, what are the differences between the Atari 800xl and the
>1200xl ??

Well...That is a difficult to say..the MAIN AND MOST IMPORTANT difference
is that the 1200XL does not have A parallel Bus (PBI) for connecting
such great things as the BLACK BOX or the MIO for hard-drives etc..
The 800XL does not have the 4 Function keys that the 1200XL has (F1-F4)
however they are still active in the ROM and can be added with a simple
kit. 800XL has built in BAD BASIC REV.B. 1200XL has none.
The 1200XL has a neat and colorful startup screen, the 800XL doesn't.
THE 1200XL HAS THE BEST KEYBOARD ATARI EVER USED! :-)
The 800XL's isn't that great. ;-(
The internal OS Differences are MANY. Think of the 8BIT computer
OS's like this:
There was REV A, the REV B for the 400/800.
There was the XL OS in the 600XL/800Xl/1400XL/1450XL
There was the XE OS (which is a modified XL os) in the
130XE and 320XE and 130XEM..130XEP....
Also a like version for the 65XE and XEGS
And out of all of these there is no comparision to the 1200XL
The 1200XL best fits between the REV B OS and the XL OS.
For Differenses in the os Consult:
ATARI 1200XL TECH. REF. NOTES Update to the 400/800 package.
(I RECOMEND This update to all XL/XE users since it easily
tells you how to redifine the keyboard map...and a bunch
of other neat-o stuff! :-)
Compute's Mapping the ATARI REVISED Edition.

4445. Ftp-Sites for Atari wanted.

Newsgroup: comp.sys.atari.8bit
Date: 1991-09-30 15:27:15 UTC
From: d1dol@dtek.chalmers.se
Message-ID: <4910@chalmers.se>
Source record: 113644

I would like to know if there are any FTP-sites for the Atari 8-bit out there.

If there is, how do I get a PC to Write Atari disks?
(ie. what program should I use, and where to obtain it.).

I don't have an 850 box or modem so therefore its very important for me to write ATARI disks via PC.

I do have two 1050 drives hooked up to my 130 XE, one is fitted with some sort of doubler chip, I can format true 180 kb from dos 4.0 , I had some other utilities on a disk that made it possible to achive much greater speed but unfortunately It was formatted by mistake the second time I used it.

I only have dos 2.0S dos 2.0Q, dos 2.5 , dos 3.0 and dos 4.0, so I would be uttermost intested in any other
better dos, such as Sparta dos etc.

I would also be very inrested in any C/Pascal compiler, prefereby pd, that is good.

Reply to:(email) d1dol@dtek.chalmers.se

Best term for an 8-bit: BOBTERM 1.2(0/1) - most file protocols, options, etc.

Best 80-column term: if you have an XEP80, probably Bobterm (with its XEP80.BTM module). if you don't, Kermit-65 v3.7 or Omnicom are pretty good...

> - Scott

Scott, well I guess I'm just an idiot. I wrote the "unbelievably slow" and "horrendous to use" ST Xformer emulator (emulates Atari 800, Atari XE, Apple II and C-64). Admittedly, they all run at about 50% the speed of a real 6502 based machine. There is however enough 8-bit software out there that not only runs on Xformer but also runs at a decent speed, even at 50% normal speed.

Now, since you're such an expert in the matter, perhaps YOU would like to write a new emulator. After all, Xformer is public domain. The source code is in the public domain. Heck, I even went and wrote a series of articles in ST Log several years ago explaining exactly how the emaultors worked.

And you know what? To date, nobody has come out with another emulator. Nothing faster or easier to use. In fact, I don't ever remember receiving any sort of correspondance from you along the lines of "Dear Darek, I have some ideas concerning your ST Xformer emulator that would make it easier to use and/or faster". No, all I have seen from you is the above message.

For your information, other Atari users and developers have contributed useful comments. ST Xformer 2.5 is a lot easier to use than earlier versions. It is also much faster. Two guys by the name of Dave Small and Jan Gray showed me about 4 years ago how to more than double the speed of the original Xformer, bringing the speed from 20% the speed of a 6502 to 50% the speed. Jan and I work at Microsoft, and Dave Small, well, you know who he is. Perhaps you'd like to suggest that all 3 of us are hopeless programmers and should take up selling encyclopedias?

As a matter of fact, my C-64 implementation of Xformer actually runs at about double the speed of the commercial C-64 emulators available for the Amiga.

So please research your topics before opening your mouth.

- Darek

I've used a SX212 modem for 2 years now - works well. I've had no problems with retries, etc when using it. It isn't a 100% Hayes compatable though. I hooked it up to an Apple IIGS using Freeterm, and it wouldn't recognize the modem. I then plugged in my Hayes Smartmodem, and it worked fine. The SX212 does work fine with an ST also.

> up. IF the only thing you'll ever use is 300, wanna trade?!?!?!?!?!?!???

WHY??? I used a PR connection for years and years. I found it to be
both reliable and well worth the cost I paid for it ($75) new.
The PR connection IS limited to speeds below 4800, but thats due to
how it hooks into the system I guess.. Still, I consider a 9600 baud
modem on an atari to be somewhat of a waste.. IF you are into file
transfers like me for the 8 bit, the largest files are usually not
bigger than a 707 sectored disk... Sure they would take seconds with a
9600 baud modem, but that extra 2-3 minutes with a 2400 baud modem
for a file transfer isnt that much of a wait... Furthermore, most atari
boards around me (and the ones I call nationally) are never equipped with
9600 baud modems..
However, You give the pr a bad rep just because YOU own a 9600 baud modem.
If you had something that ran a lesser baud rate, then you would
definitely find a PR to be to your liking.. Dont knock it.. Its
one of the most reliable pieces of atariware I have ever owned.
My drives have burned out.. My MIO went "pop" once and had to be repaired,
The PR on the other hand.. Never gave me trouble..

Here's a hot tip for all those folks (like me) who've been using the NET all this time (for me, 2 years) without the faintest idea what they're doing. Pick up the November issue of COMPUTERCRAFT (formerly Modern Electronics). There's a neat article in there called "navigating Thru Cyberspace", including sources for books describing the NET. It isn't completely accurate- they say you need a Mac or MSDOS mach. but it is informative. Recommended reading!

Regarding the several posts in IA8 V91#72 RE: the P:R:C, the variable results observed may due to which P:R:C you have. The original release version had a REV 3 board which contained bugs. A REV 3 P:R:C will *NOT* work with Dunning's KERMIT! A little later ICD came out with the P:R:C REV 4 which corrected the problems. The REV 4 board is a total redesign of the original hardware, plus there were firmware changes also. I've been using P:R:C REV 4 for 3 years at 2400 Bd with both BobTerm & KERMIT, no problem.

C'mon Colin, you really believe that line Brodie fed you? [IA8 V91#71] Atari has already announced total withdrawal from the 8bit mkt (in the US, at least) beginning Jan 1992. I don't think it is a coincidence that 5 weeks before the end of the year Atari suddenlt decides to have a "special 8bit promotion". Especially considering USA tax laws: businesses have to pay tax on their un-sold inventory in stock as of Dec 31. They know damn well they won't sell all that stuff to individual users. Thats why they wanted the vendors. The vendors would be there to *buy* - in quantity- so Atari's tax problem will become one for the vendors. Remember, Greg Pratt was involved in cooking up the idea. So why was there such poor response from the vendors? Simple: no one notified them. Wouldn't Atari send out invites to the vendors? Naahhh. Atari does not maintain a list of their 8bit vendors! Ain't that a helluva way to conduct business? Brodie roped ME into preparing the vendor invitation list! And like an ass, I did it. My reward for this from Atari is that Brodie now totally ignores me, won't answer my GEnie coms or anything. Why should he? He got what he wanted, now I'm cast aside like yesterday's newspaper. Vintage Atari mentalit mentality, business as usual.

Atari is no longer a computer company. It is an import-export company. They make them in the Orient, sell them in Europe. The USA is just a shipping station, a stop on the way so the bean-counters can check inventory. The European market looms large in Ataris future plans. Including the UK. Beware this man, Colin. He can charm the fangs off a snake. His motives are suspect, there is a price to pay for his friendship.

Abe Waranowitz, your coms get thru to me but mine to you are getting bounced. If you got a new INET address, give it to me? I sent you Ed Hall's Cursor program again; your fix introduced a small bug. Did you get it?

I also had the
P:R: Connection operating at 9600 baud through null modem. I also couldn't get it to work at 19.2, and I'm pretty sure that 9600 is the limit of the P:R: Connection.

Personally I thought I heard that ICD made the P:R: connection *better than the 850.

Stan, I recently obtained 60 pages of docs on the NS455 chip in the XEP-80.
It only took 4 or 5 tries, being polite didn't work, I finally tried lying,
that worked.
The NS405/455 is the biggest darn LSI DIP I ever saw, 48 pins. Described as
a video terminal processor. Three of the pins put out HSYNC, VSYNC, & the video
brightness signal. Sorry, I can't remember which 3 pins.
In principle it should be straightforward to connect up the appropriate wi
wires in the standard TTL DB-9 to get the signals. Hoever, I don't know if the
NS455 will drive video outputs directly, buffering might be required.
I haven't done the hack, but I been researching it, it seems possible.
It is definitely on my agenda. If you can shake the ants outta yer pants &
hold on till next year, I'll write it up in CN in gory detail, complete with
diagrams, photos, etc per my usual style.
That's all I'll say on this subject for now. I think hardware hacks
should be rigorously documented & carefully tested before they're released.
Half-baked info floating around on nets by folks who haven't done their home-
work or even done the hack themselves cause more grief than it's worth.
Be patient, have faith, & know that The Alchemist has heard you.

[It'll really change the oil in yer car & send yer kids to college, eh?
Gee, this stuuf is more potent than I realized. Here all this time I thought
it would just let me put my IBM monitor to use.]

While I hink of it, if anyone knows a commercial *SOURCE* where you can
buy the NS405 or 455, post to the NET! Also a source for the 8040/8050 CPU
used in the XF551 (or substitute therefor).

From: Chris_F_Chiesa@cup.portal.com
Message-ID: <48110@cup.portal.com>
Source record: 113565
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st.tech

I don't know if this will reach you, or what other discussion may have already taken place -- Portal's news software and feed have been wacked out for a couple of days -- so if you see this on a non-Portal site, pop a reply to me in e-mail...

Anyway -- I, too, have long considered writing an Atari 8-bit emulator for "the other 68K-based home computer," but am realistic enough to admit that it will probably be many years or decades beforeI accomplish this feat, if I ever do.

I do, however, have some thoughts on how I'd go about it.

I'd start by emulating a raw 6502 CPU, without any particular supporting hardware. Of course I'd have some jacket code that initialized the 6502 environment, then went into "6502 emulation mode."

Then I'd be able to implement commercial-product-specific emulations as a series of external "environment" files, loadable by the jacket code just before entering 6502 emulation mode. One file would bring up an Atari 800-series environment; another a C= 64; another an Apple IIe, etc. As far as the 6502 is concerned, after all, it just executes instructions and accesses memory. The "environment" files would be responsible for mapping memory references into custom-chip emulation registers etc.

All you would need to do in the enviornment files would be to emulate, or provide for the emulation of, each environmment's complement of custom chips. I'd handle this by having the CPU emulation's memory-referencing code look at a table, part of the loaded environment file, that identified every address in 6502-accessible memory as being RAM, ROM, such-and-such custom chip, banked, etc. etc... (Some research would have to be done to nail down a comprehensive set of identifiers.) If I decided on sixteen different types of "memory" references, that could be represented in four bits per location, making half a byte per 6502 "memory location," or 32K to map a 64K stock Atari 800. That's a pittance on the 68K system of which we speak, and could be multiplied by several powers-of-two without even burping. Then, any time the 6502 CPU "referenced a memory location," the emulation code would look up the memory "type," and vector to the appropriate RAM, ROM, or custom-chip memory-reference emulator.

Each custom chip could be implemented as a dispatcher which decoded the function of the chip register being accessed, and vectored to appropriate code. Each custom-chip emulation would maintain its own internal database -- and could even be implemented as a separate multiprocessing "task," on the 68K system of which we're speaking.

It starts to sound so EASY now that I write it down! :-)

This sounds like a reasonable approach, but realize that the custom chips are going to be very hard to emulate at full-speed (if you can do it at all). Consider the chip in the Atari 800 that reads the "display list" and updates the screen accordingly; you would have to "emulate" this chip at every single ST horizontal blank interrupt, and the emulation is not trivial. (Remember that the 800 had text modes, with different sizes of text. You could mix and match text on the screen arbitrarily using the display list. Many games were written to exploit the hardware text modes because changing a character's image data would cause all occurrances of that character on the screen to change immediately, just like changing a palette register on the ST causes all pixels of that color to change immeditately. Whereas the ST has only hardware palette animation, the 8-bit had hardware character animation too.)

I assume the way you describe is the way Darek has done Xformer, particularly since he has emulators for other 6502-based machines as well. An alternative approach, however, might be to try and translate 6502 code to 68000 code all at once, and then run the generated 68000 code. This would be faster (probably fast enough for full-speed emulation on an 8Mhz ST, but that's just speculation), but is LOTS harder, because you have to make sure you don't misread data as code and convert it. I think that solving this problem in general is impossible, but perhaps with clever heuristics it would work for enough 8-bit programs to make it useful.

Just a thought.

But we're talking about an Amiga here (at least I think that is "the
other 68K computer, geez) and the Amiga has something similar to a
display list; the Atari display list could possibly be translated into
an Amiga equivalent for custom graphics manipulation.

>interrupt, and the emulation is not trivial. (Remember that the
>800 had text modes, with different sizes of text. You could mix
>and match text on the screen arbitrarily using the display list.

The mixing of text and graphics could easily be handled in the routines to
translate the Atari display into the Amiga (or any other computer) display.
It would be pretty easy to check and see what type of graphics are supposed
to be displayed in that display list line and update the screen accordingly.

>Many games were written to exploit the hardware text modes because

The character animation would be a little more difficult, but you
might be able to accomplish it by redrawing the whole screen every
time the character set is changed. However, this might not fit in
well to the abstraction of the custom chips.

You know, the custom chips for the Amiga were done by the guy who did
the custom chips on the Atari 8-bits. In fact, I think the Amiga is
more like the 8-bits than the ST's. The ST, in fact, are closer to
the Commodore 64. So I don't see what this "other 68K computer" stuff

is about. Unless it refers to the ST's. In any case, I think it's pretty silly.

Now what about interfacing a ST with a 65c02? (Sorta like the IIe card
for the MAC LC)

Use that 65c02 for the processing power and emulate all the special
chips (GTIA, ANTIC, POKEY,...) in software. Then it would be easy to do
Apple IIe and C-64 without having to worry about emulating the 65c02.

For the Apple IIe, couple it with some GCR disk drive hardware, and then
you can read/write Prodos disks.

(BTW, in Spectre GCR, how much hardware is involved to R/W mac disks?)

Hi

I have finally come around to pre-releasing my ST-Atari 8bit
parallel connection. It's basically just an improved plug that
goes into the joystick ports and the printer port.

A device handler N: is loaded into the 8Bit, which whom you
can access GEMDOS files directly on your ST. (at speeds I might
add that will astonish you).

The kit instructions plus software are uploaded to

atari.archive.umich.edu in atari/8bit/nasty.arc (6.02 ARC)

Hope someone will get some use out of it.
Ask me if you have any questions/problems..

Nat!

P.S. having SpartaDOS 2.3 is highly advantageous!

4465. Does the Black Box connect to Atari 800?

To All My Friends In The IA8 Newsgroup:

I just got word that tomorrow I'm getting a Mac SE to replace the 800XL that has been a comfortable fisxture on my desk here at work for the past 5-1/2 years.
For some period of time, I don't know how long, I'll be off the Net until the MacChangeover is completed. If you send me email, it probably won't get answered.
I didn't want the damn thing, but to refuse it would have incurred a political liability for me. This is after all a business environment. And I'm hopelessly addicted to a regular paycheck.
Back in Sept '90 I bitched in my "Alchemist" column about the lack of professional applications for the Ataris, the 8bits especially. The reason my Atari must go is beacuse I can't draw chemical structures with it. Chemical structures consist of various collections of polygons connected by lines with subscripted/superscripted alphanumerics thrown in, & the ability to prinit it out in 24-pin resolution. Certainly a job well within the capabilities of a RAMBO'd 800XL with an XEP80.
I saw this coming some time ago. During the past year, on atleast 7 or 8 occasions, I tried to talk some 8bit programmers into writing a structure drawing program. As soon as I said the word "chemisry", to a man they all turned pale green & ran like rabbits. If it isn't a video game in player-missile graphics, 8bit programmers want nothing to do with it.
But Mac programmers have no problem writing porfessional applications. ChemDraw, ChemIntosh, ChemDTP, take yer choice.
I can only wonder, how many people have been forced away from one hard-ware platform they really liked, into one they didn't like, merely because of the existence of software applications for the undesirable platform.
The XL on my desk is already fully tax-depreciated, so financially I've certainly gotten my money's worth from it. But next Monday, when I come to work & see that stupid-ass Mac on my desk, I will know I have lost a friend.

Lines: 16

Well STeve it seems that I was wrong (we can't all be perfect can we?)
and I can send a file through Usenet to you. The cost to me is 10c for
the first K and 3c for every K after that which is $33 per megabyte,
I don't know if you would have to pay at your end but at the size that
our packets are normally I would say it would cost peanuts, what do
you think? Shall we give it a burst to see how it pans out? I am going
to go and make up a packet right now and send it as an experiment, let
me know if/when you get it and we'll go from there shall we? Also let
me know if you are getting your email okay. I hope you have your MIO
fixed again by now, if not and you do get my packet maybe you could
pass it onto one of the other OasisNet nodes for me, perhaps Don Baldwin
in Newport News, VA. I haven't had any messages from the Professor since
about the 15th September so if you could send me a packet made up from
around that date I would appreciate it. Looking forward to hearing from
you....Pandora

Hello All,
This is my first posting (attempt) to the net, even though I've been reading
this newsgroup for over a year. So, this is more or less a test message.

My first question to the net is:
I bought an ATR8000 from a friend about 2 years ago, and have been tinkering
with it every now and then. I can't seem to get the thing to work, I've tried
to hook up IBM drives (360K) to it, but no luck. All I got with the beast
is the manual and a couple of cables, no software at all.
So, any help in getting this thing to work will be greatly appreciated.
I'm also looking for the Disks that came with the ATR8000, and the CP/M
manual and disks.

Thanks...
Chi K. Chan
ckchan@csserv1.ic.sunysb.edu (UNIX)

Not necessarily - much 8-bit software modifies the display list on the fly.
Imagine a piece of software that modifies its display list from within the
horizontal blank interrupt (not unknown - I wrote a routine to do parallax
scrolling that did this) - to do this on the Amiga you would have to be
able to emulate fast enough to emulate the hblank 6502 code *and* perform
the necessary transformations to rebuild the Amiga display list
accordingly, all within the horizontal blank.

> The mixing of text and graphics could easily be handled in the routines to
> translate the Atari display into the Amiga (or any other computer) display.
> It would be pretty easy to check and see what type of graphics are supposed
> to be displayed in that display list line and update the screen accordingly.

The trick, though, isn't just to build up a display, it's to build up a
display *quickly*. The minute you start modifying display lists on the fly
you require your emulator to go a *lot* faster. Darek's emulator is slow at
times but I think he's pretty much gone as fast as you can go on an ST and
he's provided a very complete emulation (I was delighted upon running
XFormer to discover that you could build custom display lists etc). While
the mapping between the Atari 8-bit and the Amiga graphics hardware is a
good deal closer (due to one being the ancestor of the other) the amount of
effort and cleverness required to transform between one and the other
efficiently might be better spent just using a brute force method of
building the screen.

Message-ID: <1991Oct4.203340.17044@magnus.acs.ohio-state.edu>
Source record: 113574

To answer your question, it is not possible to hook the Black Box up
to an Atari 8oo. The 8oo does not have a Parallel Bus Interface (PBI),
as do the Atari 8oo XL and 13o XE computers.
If you prefer the 8oo for its keyboard, consider using an XL or XE with
a Transkey and Black Box. The Transkey allows you to hook up a standard
PC keyboard to your 8-bit.
It might be possible to use an 8oo as a slave on a multiplexer system,
with the multiplexer tied to an XL or XE. The CSS Multiplexer manual
mentions this, but says to contact them about installation.

4472. Atari 520 system for sale

Newsgroup: comp.sys.atari.8bit
Date: 1991-10-04 22:32:07 UTC
From: gathings@hydra3b.cs.utk.edu
Message-ID: <kepqv7INNofr@utkcs2.cs.utk.edu>
Source record: 113576
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit

I have the following system for sale :

Atari 520 ST with, external drive(ssdd), mono monitor,
system disks, and various software (tell me what you
are looking for).

Software that might be of interest to some :
- 1st word word processor
- Uniterm vt100 term program w/ xmodem/kermit
- protocols and tektronic graphics emulation
- Hippo C compiler
- Degas , publishing/paint program
- Asmpro ,a 68000 assembler.

external 1200 baud modem with cable and manual

asking $300 , or best offer (price includes shipping).

As a last resort , I will split up the system but, the
prices may be less negotiable. I used it as a general
purpose machine in college and it served me well. I
am now selling it because I have a 386 system.

Thanks

Golando.

4473. SIO2PC and duplicating old 8-bit programs

Newsgroup: comp.sys.atari.8bit
Date: 1991-10-05 22:00:48 UTC
From: mfontana@eniac.seas.upenn.edu
Message-ID: <52695@netnews.upenn.edu>
Source record: 113577

Hi all,

I recently found out about the "SIO2PC" project, which basically allows
you to replace your old Atari floppy drives with a set of disk images
stored on a PC compatible's hard disk. A simple interface connects the
Atari's SIO port to a standard IBM serial port. The system is completely
transparent on the Atari side; you can even boot from the IBM. There
is reportedly a significant increase in speed.

I'm planning to build the device, as I'd like to keep my 800 around
and this will make it convenient and reliable to use. (Many of my old
Atari disks produce that slow, haunting "blip-- blip-- blip--" of sectors
gone to heaven.) The device also has some nice extra features, like
redirecting "P:" to the IBM's printer, etc. I recently spoke with the
author of SIO2PC, Nick Kennedy. There are about 30 happy users of
his project, and he has just completed an update of the IBM driver software.

I do most of my graphics work (raytracing, animation) on my 386 machine,
but I'd like to use the 800 for video titling, speech synthesis, and games.
(In my opinion, many of the old Atari games rival Nintendo...)

I used to have a fairly large collection of Atari programs, but I ended up
selling just about all of them. Now, of course, I want to kick myself!
There are very few places to find 8 bit games and software these days.
The only real solution is finding individual users who still own them.

I haven't been involved in the 8-bit scene for a while, but it seems
most of the major software companies for the Atari no longer exist. So
what's the deal with copyright restrictions? If no one's there to lose
money, is it okay to make a copy? Most of the devout Atari folks I know
hold the belief that that's irrelevant-- it would be blatant PIRACY.
This is kind of a new ethical issue developing as the first generation of
micro-computers slowly dies.

Any opinions on this? I think that the combination of SIO2PC, Internet,
and this "vaporization" of Atari programs into the public domain could
breathe new life into the old Ataris.

More information on SIO2PC can be found at atari.archive.umich.edu or
by contacting the author, Nick Kennedy, at (501)967-3843.

Anyone wishing to discuss these issues with me privately, please mail
to mfontana@eniac.seas.upenn.edu.

Thanks,
Mark Fontana

My own feeling about "piracy" for the 8bits is: if the product is no longer commercially available, and a copy can be obtained without profit to the provider, it's morally okay to use that copy.

I'd think thath would be a great Idea, I would gladely upload some classic Games like Pac-Man etc. if I knew were to upload them, and if others also did that, we could get a very interesting
Atari 8-bit ftp liberary somewhere.
With all respects, I wouldn't call that PIRACY.

I mean, like for a car, the manufacturer stopped making spares, should we just throw the darn thing
away, should we?

Yes, we're talking about an Amiga. I don't consider the Mac a _home_
computer.

I was indeed figuring on taking the copper list approach to DLIs. Why
reinvent the wheel? However, what might be more difficult is getting the
instruction execution rate right for cycle-counting programs. The Atari
executes a certain number of instructions per color clock, and I'm at loss
for a way to get that right. I don't think it actually matters in most
programs, but you never know.

>The character animation would be a little more difficult, but you

Character animation hadn't occured to me. This is why I posted this
request in the first place. I figured someone else would have already
thought of all these problems, and maybe even some solutions.

I have the following software for sale:

Defender
PacMan
MrsPacMan
Eastern Front
Centipide
Millipide
Missile Command
Caverns of Mars
Ghostbusters
Pole Position
Galaxian
Joust
Robotron
Dig Dug
etc.

If interested send email with the price your willing to pay.

Thanks

4481. Networking to IBM???

Newsgroup: comp.sys.atari.8bit
Date: 1991-10-08 16:51:35 UTC
From: Preston.F.Crow@dartmouth.edu
Message-ID: <1991Oct8.165135.22104@dartvax.dartmouth.edu>
Source record: 113587

I would like to find some way of using my 386 clone as a file server for my 8-bit. I figure that it would be possible to make a physical connection through joystick ports 3 and 4, a printer interface, or some other port to some IBM port. The software level could be accomplished through a modification of the ROM or (it would only work with some programs) a modification of DOS. The ROM modification could be done for an 800XL through a modified translator disk.

The basic point it that I've found my drives are a bit unreliable, and by putting the files on my IBM, I would have much more efficient access to them. Unfortunately, I don't have the time to write the software myself... Has anyone else been working on something like this???

Hi Ron,
and hi to the rest of this newsgroup. This is my first posting here, I have been reading this for the past 4 months. For the longest time I thought my uncle and I were the only 8bit users around. Anyway, glad to see you folks around.

Ron, the later models of 8bit computers are the XL and XE series, they are nearly 100% compatible. Nearly, because some of the older software made illeagle calls to the OS. However, a couple of programs are available which will allow you to run even those programs, one is called Transformer.

As for hardware and software, B & C computers out of San Jose CA probable has what your looking for. I don't remember the address right now but I will post it later. I also have a supplier just down the road from here in San Antonio TX, he sells all kinds of 8bit HW and SW, if any one is interested I will post a list of what he has.

And now I have a question for any programmer out here in cyberspace, I am trying to write a simple AI program. Simple in the sense that I want the computer to try and guess my 5 digit number using limited clues provide by me. I know this probably sounds archaic and my have already been done but not by me. Learn by doing, but I could use a little help with this one. BTW I'm using Basic XL on a 130XE with two drives. I know that I should probably be using LISP

or something like that but......

Well, thanks in advance and hope to hear from you all real soon.

As I posted just a week ago, I have uploaded somthing
similiar to what you want, to "terminator" in NASTY.ARC (ARC v6.2)
Unfortunately for you it doesn't run on the PC, but on the
ST (up to TOS 1.4 at least) and it uses stickports #1 and #2, cause
my XL uses PORTB otherwise. If you want to consider writing
a server, than you are all set 'cause NASTY contains the 8-bit
software and the interface board (not quite the physical thing
in the .ARChive (har har)) needed. It's actually pretty
simple if you know how to handle the port. Write me if you
want to do it... Else try SIO2PC, which sounds pretty good
alas serial.

Nat!

P.S. Speedwise you won't be disappointed.

> P.S. Speedwise you won't be disappointed.

But one nice thing about SIO2PC is that it is completely transparent
to the 8 bit; no need to run driver software, and all 4 joystick ports
remain available. It's designed to run at the standard SIO port rate
(19,200 bps), but users report a significant increase in speed over
using a real Atari drive. I imagine this is because the PC is sending
almost a continuous stream of data, since the disk images are stored
in the PC's memory.

BTW: Does NASTY deal with protected boot disks? This isn't implemented
in SIO2PC yet, but I was thinking about adding it. (At least for the
type of Atari disks that check for a bad sector around 715-720).
Anyone have the technical reference? I need to know what status is returned
by the Atari drive after reading a bad sector.

Scott,

This is what you'll need to hook up that 20 meg SCSI drive to your XL or XE computer: an interface, case, power supply, cables and some software.

There are two interfaces currently available for the XL/XE computer, the MIO from ICD (815-968-2228) and the Black Box from CSS (716-586-5545). If you own an XE computer, you'll need to buy the inexpensive adapter card from ICD or CSS, which combines the parallel bus interface with the cartridge port

on these machines.

The MIO comes in it's own case and features a ram disk (256K or 1 meg), parallel and serial interfaces, and a hard disk interface - it used to cost about $300+ - though with the clearance sale at ICD you might get it cheaper.

The Black Box is a circuit board which features serial and parallel interfaces, and a hard disk interface for $200. You'll need a case to put this in, either a seperate box or inside your hard drive enclosure - check with CSS for size and power requirements.

For cases and power supplies, just about any external hard drive case and power supply will do. Some things to keep in mind: bigger power supplies are NOT always better - the really big ones (200 watt+) won't even work unless they sense a load on the line. A power supply rated between 30 and 70 watts should work OK for a single hard drive setup. Also, be sure you get a power supply rated for a hard drive, not a floppy drive. Hard drive power supplies are designed to run 24 hours a day, floppy power supplies aren't. You can buy these cases/power supplies at all the computer shows, ICD, CSS or IB Computers (503-297-8425), a long time Atari dealer who specializes is drive cases and power supplies. Make sure the you get a case which includes at least a fan to cool the power supply. Some brands of hard drives (Maxtor) run pretty hot - you might need another fan for the drive also. A case and power supply will cost between $50 and $150.

The only cable you'll need is a SCSI cable - a 50 pin (2 rows x 25 pins) ribbon cable with a female connector on each end. They usually cost $5-$10 - I've sell you my extra cable for $3 if you're interested. The cable connects the hard drive to the interface.

The last thing you'll need is the hard disk driver software and DOS. The two choices are SpartaDos from ICD or MyDos from Bob Puff (who just recently became the owner of CSS). SpartaDos is much more polished, offering time/date

stamping of files, I/O redirection, a much more advanced directory structure and many other features. SpartaDos X cartridge now costs around $50 from ICD.

MyDos 4.5 is much closer to Atari DOS 2.5, except it features subdirectories,

configurable ram disk sizes and hard disk support - it is shareware. To summarize, MyDos offers better compatability with most programs than SpartaDos, but it has fewer features.

That should give you a general idea of what you need to set up your hard drive. I would check with the manufacturers before purchasing any hardware - I
am not an expert on 8-bit hard drive systems, only ST hard drives. You might want to check with the sysop of the Q BBS, as he has a hard drive running on his 8-bit system. See you at the meeting.

>
>
> Mark Fontana

Nasty doesn't deal with protected boot disks, 'cause
there aren't any on a GEMDOS file system, if they are
they are 68000 code and the 8-Bit doesn't care for
that (har).

In case I didn't explain that thoroughly, NASTY goes
like this:

Connect PORTA (stix #0-1) of your favorite computer to
the PSG parallel port port (of the ST) via the NASTY board.

Start up driver on ST (botched multitasking..)
Start up driver on 8bit

use N: just like any other device, for example
with SpartaDOS 2.3 you can say:

D1:CWD N:C:/USR/SRC

D1:DIR *.S65

<faked output here>
FOO.S65 35363 12:08:91
BAR.H65 8277 11:08:91

D1:COPY N:*.* D3:
FOO.S65
BAR.H65

D1:

So in that respect it's totally unlike SIO2PC. The advantages
are that you can easily crossdevelop, that you are only limited
by the available diskspace and that you are actually using GEMDOS
so that you can manage your files outside. And of course its
just that much faster, than 19200bps, more like 80000bps.
(actual thruput)
```

What you cannot do is , boot up with NASTY alone (DOS required) or run 'sector oriented' software from it. It was a design choice and I preferred it this way. (That's because I can now assemble and link my code on the ST. if you ever used make and TEMPUS it's hard getting back to E: and MAC/65)

How about creating a bad sector yourself and then reading that value in, that should do it.

Nat!

Try to FTP the Sio 2 PC files from the Atari Archive at the University of
Michigan, you dont need to use the Joystick ports, but can use the Sio.

This is from
ncrawler@bluemoon.rn.com
ncrawler@bluemoon.uucp

Atari 400 These are all upwardly compatible, there are a few games out
800 there that will require a translator disk to run some older
600xl programs. There is also a 1200xl that is supposed to be
800xl compatible, but there are some problems with it.

It just occurred to me that there is no newsgroup for 8 bit binaries.
There's a c.b.apple2 group, so why not one for the old Ataris?

Let's have some opinion. How does a new group get initiated, anyway?

Well, I finally got rid of my Atari 8-bit machine (after I blew one of the custom chips) so I would like to unload some of the manuals I have.

Atari Hardware Manual
Atari OS Programming Reference
Atari OS Source Listing
DeRe Atari (All about ATARI)

Also, I have the Action! Development system.

I would like to get rid of these items for the cost of shipping and some token payment.

I believe there is such a monster out there (SIO2PC or something
like that). It is a hardware/software setup to allow such a thing
to occur. Unfortunately I do not have any more information on it,
but I'm sure someone here does. Wouldn't that be great to tell
at a PC meeting: "I'm using my PC as a fileserver for my 8-bit."
I'd love to see their expressions...

There are not enough binaries posted to justify a new newsgroup. Feel free to post binaries to comp.sys.atari.8bit; that's how its been done up to now.

Well, you know the SIO 2 PC could be used for a BBS, but only if the size
if the drives could be increased. I wish that you could or would add a
way to have a 5 meg partition so that all of the BBS files could be stored
on the IBM hard disk. I know that running it on a 386SX with 28ms hard
drive, the system would still be faster then 1050's and XF551's!

I believe ALL 8-bit models except the 400 have composite video output.
Not sure about the 600XL or the XE Game System.

4506. Re: Atari 8-bit emulators

Newsgroup: comp.sys.atari.8bit
Date: 1991-10-10 15:39:06 UTC
From: Chris_F_Chiesa@cup.portal.com
Message-ID: <48418@cup.portal.com>
Source record: 113538

I think it goes without saying that NO Atari 8-bit emulator, on the Amiga or anywhere else, is going to run ALL Atari 8-bit programs without problems. No matter how sophisticated the emulation, the bottom line is that it's NOT REALLY AN ATARI running the program, and something, somewhere, is going to turn that up someday. C'est la vie. The best we can do is to allow the greatest possible number, and widest possible variety, of programs to run as well as possible. At some point in the design phase, you just have to decide you've done what you can and it's time to start implementation.

4508. I will offer an 8bit ftp library

Newsgroup: comp.sys.atari.8bit
Date: 1991-10-10 16:55:16 UTC
From: cwilliam@mimsy.cs.umd.edu
Message-ID: <CWILLIAM.91Oct10125516@mimsy.cs.umd.edu>
Source record: 113516

I would be willing to offer an 8bit library online via ftp or mail.

I have quite a collection of 8bit stuff. I personally feel that for
software that I can no longer purchase, copying it seems okay to me
since you are not hurting any companies business.

However, my little knowledge of copyrights tells me that the companies
that have been bought out also have their copyrights bought out and
even if the companies no longer produce or support the software their
copyright still holds legally. Not that a company would probably
bother to sue anyone since they would not be loosing business, but
I obviously cannot expose myself, my lab, and my department to
complaints about software piracy. So if someone out there can contact
some of the software manufacturers or a copyright attorney, I might
consider putting up an ftp depository of all the 8bit stuff.

Chris

This sounds exactly like what I wanted to do some time ago - have another
computer acting exactly like a (very) expensive disk drive. For me, writing
the software was not the problem. My big problem is the hardware reqired:
How are you hooking the serial port up to the PC? Through the PC's RS232 port?
If so, what kind of hardware is required to convert the Atari's serial
to RS232 serial?

Source record: 113515

The 800 sure had a composite video port. Although I used a TV as a display, I figured I could use it somehow. So I bought a $8 cable from Radio Shack which had one end a "standard" composite monitor plug (standard circa 1985 or so) and at the other end, five different RCA phono jack-type plugs (like the kind used to hook stereo components together.)

One of the RCA plugs carried sound info only. Finding out which one, however, involved some trial and error, and a sincere hope I wouldn't blow out my stereo amp by plugging it into a video signal...

Once I found the right one, I put a Y-adaptor on it, and plugged it into the AUX jacks on the back of the amp. Voila-- amplified 2-speaker Atari 8-bit sound! Although it wasn't stereo, it was coming from 2 speakers, and if you cranked up the bass, some arcade game explosions could be really earth-shattering. The 8-bits had amazingly good sound-- 4 voice polyphony was used quite well by game authors to produce overlapping sound effects. You also could tape the music/noises of anything your Atari could produce... I taped the theme song M.U.L.E. plays at the beginning because people I knew found it intensely annoying and I wanted to torture them with it ;-)

Dunno about the other 8-bits. Seems to me a monitor port was considered as a premium item. Like 400s, 600XLs, and other low-end products wouldn't have it, but 800s, 800XLs, 1200XLs, and XE's would...

>If so, what kind of hardware is required to convert the Atari's serial
>to RS232 serial?

Yes, SIO2PC connects the Atari's 13-pin SIO connector to a standard
9 or 25 pin IBM serial port. A simple interface is required to convert
the Atari's 0/5v TTL signals into the RS232 standard's +/- 12v signals.
The kit involves 2 ICs and 5 capacitors... that's it! (ICs are
74LS368 and ICL-232/MAX-232.)

The only problem you'll have is ordering the IC's... most places large
enough to carry the ICL-232 have a minimum order requirement of like $20,
and the IC is only like $4. The designer of SIO2PC (who is unfortunately
not on the net), has ordered these parts in quantity and will sell
a complete kit (includes cables, project box, software, etc) for $30,
or an assembled and tested interface for $50. He'll also negotiate
if you need, say, just the IC's.

The IBM driver program for SIO2PC is a 13k .COM file written in 100%
assembly language.

I will be posting the latest update of the SIO2PC instructions and
software to atari.archive.umich.edu within the next week or so.

4515. Get ready!

Newsgroup: comp.sys.atari.8bit
Date: 1991-10-11 00:53:34 UTC
From: n160ao@tamuts.tamu.edu
Message-ID: <4707@tamsun.TAMU.EDU>
Source record: 113444
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit

It looks like we are about to get a new generation of USENET users in comp.sys.atari.st. The bombardment of computer sales over this facility tells me that the experienced (but not developer) users are leaving atari for more prestigious computer systems. This is great news because we should see a new wave of enthusiastic users who got a really good deal on the computer that provides power without the price (and in this case really without the price).

This prompts me to re-encourage us to make the atari archives as user friendly as possible. This includes documentation to set up

- MiNT
- command line editors/shells (bash, gulam, ksh)
- TeX/LaTeX
- Uniterm Macros
- Sozobon C (I think the easy to install package already exists)
- GNU C
- g++

Also, its time for us to be flame-retardent. Don't flame, and when you see a flame skip it (I use the "k" functions of rn).

Thanks for your time.

The 600XL does not have a monitor port. The 800XL has a monitor port
with seperate Audio/chroma/luminace/video lines...however either the
chroma or luminance pin is NOT hooked up and must be jumpered with
a resistor.

>There's a c.b.apple2 group, so why not one for the old Ataris?

Instead, how about a slightly broader group that just might get enough traffic to be worthwhile: comp.binaries.8bit. This would be a place for binary posting for ANY 8bit computer, not just the Atari. CP/M postings, for example. I've never noticed a comp.binaries.c[64|128] group either, so this could be useful to them too. Of course, it could easily get to be too broad...

Perhaps it would be better off as alt.binaries.8bit ?

[Until then, I agree with another poster: just keep on postin' right here.]--

You will also need a hard disk controller that goes between the Black Box and the HDD, either a SCSI or SASI, something like the Adaptec 4000A. Plus quite a few more cables than you mentioned. If anyone is interested I will repost an excellent article that I captured in this very Newsgroup a few months ago (maybe even last year) on the MIO's and the Black Box and comparing what each one did.

Source record: 113517

Last week I built the SIO2PC (which connects an 8-bit atari to a PC) and I have got to admit it is pretty neat. Construction was fairly easy as I wire-wrapped it then trimmed the pins later to get it fit in the box. Total cost was probably $20. The only thing that was a gotcha was the connections described for the PC side are for a *9-pin* serial port and I was wiring it up to a 25-pin port and the pin connections are different. This is covered in the instructions but I just missed it.

The version of the software SIO2PC.COM (PC side) is 2.5. Is this the latest version? My copy may be corrupted because when I exit the program or enter the 'Adjust Timing' menu, I get weird characters on the screen with few recognizable words. The other parts of the program seem to work ok. It is really a kick to boot up my 800XL and have my programs loaded from the PC. You can almost think of the Atari as a game/graphics engine for the PC. :-)

I7d like to see that article you mentioned. I think I am going to go with
the Black Box, I already have anough problems with a previous ICD product...

/ 91Oct11 9:49 am From: Scott Emerle Subject: PR Connector war

Asgardia@Unixland.natick.ma
Well, for one thing, I know more 8-bit bbses that use a 9600 baud + than I
do
ST bbses!!! And as far as the best reliable thing made for the 8-bit, I
disagree as well. My 8-bit itself has NEVER died (and it is 2nd hand), my 810
drive has died twice because of me fooling with ut (don't ask how, I just
messed it up bad), but the 810 is a far better drive than my 1050. The 810
would read ANYTHING all the time, even when the 1050 or that other precision
drive wouldn't.
Sorry to here 'bout the MIO popping, but that's ICD for you. They don't
make
good HD's either.

The 600XL uses the same motherboard as the 800XL. When I first got mine,
I added the parts needed to make it possible to hook it up like an 800XL
and also made it a 256K internal RAM model. Adding the DIN connector is
quite easy if you have the parts and a schmetic or an 800XL to copy off
of.

From what I remember about the 8-bit, the computer communicates to
the screen at 9600 baud, so you can't have a modem running at that
speed if you're trying to print to the screen. But if you buffer it
straight into memory, maybe turning off the screen DMA, there's no
reason you couldn't get it running that fast...

4531. CC65 and Ace C library doc's are available

Newsgroup: comp.sys.atari.8bit
Date: 1991-10-13 04:53:24 UTC
From: millerm@mozart.cs.colostate.edu
Message-ID: <18411@ccncsu.ColoState.EDU>
Source record: 113535

Two documents on the libraries of two 8-bit C compilers are now
available at the atari.archive.umich.edu anonymous ftp site.

John Dunning, the author of CC65, said in his documentation that he
had not written any detailed doc's for the C.OLB library. I wanted
to learn about this compiler myself, but I couldn't really do that
unless I knew what was in the library. So I decided to write this
documentation myself. It was a very long project as I had to
determine how the functions worked (what they did, and what values
they returned) by reading through the library source code almost with
a fine-toothed comb. I also talked quite a bit with JRD on this
doc. And it has his blessing :-).

The Ace C library documentation I wrote is really supplementary to the
doc's supplied with Ace C. I wanted to put the descriptions of the
functions in the libraries in a cleaner format. And I added some
information of my own, such as if an Ace C library function
corresponds to a C function in complete C language implementations.

The CC65 library documentation is in atari/8bit/cc65. I think it is
called libdoc.arc. The supplementary Ace C library documentation is
in the 8bit directory, and it's called aceclib.arc.

From: st13w@menudo.uh.edu
Message-ID: <ST13W.91Oct13162458@menudo.uh.edu>
Source record: 113539

Greets, All...

In this diverse collection of computers around me is a lone Atari 400 that I would like to make operable again. At the recent Atari Safari held in Houston, I picked up a good condition 410 tape drive (for $3.00!) which gives this dusty beast something besides cartridges to fiddle with. :) The electronics work fine and the game cartridges can be used, but there's a problem with the membrane keyboard. (As if a membrane keyboard wasn't a problem to begin with!) Does anyone know of a mail-order place I can buy a new keyboard? How about a mechanical keyboard that will work with the 400?

My other question concerns an "AtariLab Interface" I bought at the same time. This cute thing is about the size of the keypad that came with that Star Raiders game for the 2600, but instead of keys it has eight RCA-type connectors into which you can plug a simple probe (or two or three? dunno I only have one with it right now)...presumably a tidy way to measure "lab stuff" like resistance through the joystick ports. Plugging into the ST ports while running Uniterm (live action here! :) brings a response similar to a button-press...no big surprise, I suppose. Anyway, is anyone familiar with this critter and do they know of any software or tech-info on it?

Thanks!

According to Bob Puff, it is possible to attain true 9600 baud
communication through the Data Bus, or serial bus on the 800xl and 130xe,
but not through the sio port.

My set-up is simple. I have an 800XL with a P:R: Connection. From there, I have a null modem that goes to my PC. The software is important. I use BobTerm. Other packages may not be able to handle 9600 baud.

On re-reading those two messages I find that I missed fixing a few mistakes
I made. When editing it I did a 'search and replace' with the word 'and'
to '&' and didn't realise that it changed EVERY 'and' even if it was
in the middle of a word! So if you find some of those you now know what
it is supposed to be.

~>The 600XL uses the same motherboard as the 800XL. When I first got mine,
~>I added the parts needed to make it possible to hook it up like an 800XL
~>and also made it a 256K internal RAM model. Adding the DIN connector is
~>quite easy if you have the parts and a schmetic or an 800XL to copy off
~>of.

The last two issues of Current Notes have had an extensive article by Ben Poehland, the 8-bit Alchemist, detailing how to improve the video on an 800XL, and I believe he mentions that this can be done to a 600XL to add composite (and probably chroma/luma) video. Lots of detail.

Ben is also active here - I'm sure he'll respond. Subscribe to Current Notes - it's bar none the best source of info for all Atari computers (in the U.S., at least).

4542. Atari Term Program (Atari 800)

Newsgroup: comp.sys.atari.8bit
Date: 1991-10-14 21:10:35 UTC
From: piatej@aix.rpi.edu
Message-ID: <6capsxc@rpi.edu>
Source record: 113543

Hi,

I'm looking for a terminal program for a friend that can upload and download files using some sort of standard protocol (i.e. kermit, xmodem, stuff like that). Since he can't download already :) I'd need to get it on disk. If someone has a PD term program like this and is willing to send it, I would be more than willing to pay for the disk and postage.

Please email....and the computer is an Atari 800 in case you missed the title :)

Thanks,
Jen Piatek (piatej@rpi.edu)

==========

THE 8-BIT STATE: Adding BIG Power to your little system.
---
by Chuck Steinman

One of the most significant time saving and productivity raising
peripherals you can add any computer system is a HARD DRIVE. That goes
for the 8-bit Atari too, and once you have one you will wonder why you
hadn't upgraded before. There is something about having many megabytes
of files instantly available on the 8-bit that is nothing short of
amazing. And the speed of access and loading is blinding--quite
literally indistinguishable from the speed of a RAMdisk.

While there were hard drives made for the original 800, they appear to have
gone underground over the years. We'll concentrate on the newer systems.

THE HOST ADAPTOR

The gateway to hard drive use is the device called a HOST ADAPTOR.
There are two main units used in the classic Atari world, the Multi-I/O
(MIO) from ICD, Inc., and the Black Box (BB) by Computer Software
Services (CSS). Both provide similar performance, with each offering
their own special features. They both connect to the Atari 600XL and
800XL PBI (Parallel Bus Interface) and to the 130XE through the ECI
(Enhanced Cartridge Interface). Several other companies used to market
hosts for the classic Atari, and their products might still be available
either second hand or from dusty dealer archives. Beware, it might be
impossible to find technical support.

The MIO has been out for many years, but ICD is presently trying to
close out their 8-bit lineup. One of the unique features that the MIO
offers is its built in RAM. You can order the MIO with either 256K or
1M bytes of RAM, which can be used as a RAMDisk or a print spooler. The
amount of RAM dedicated to each function can be user programmed using
the built-in configuration menu.

The Black Box does not have a built-in RAMDisk, but does have an optional printer buffer. There is a print screen button, which will send a text/graphics dump of the current screen contents to your printer. Another pushbutton will activate the BB debugger, extremely handy for programmers. The BB also has a port on it for a parallel floppy drive, but they are not available.

Both the MIO and BB will control up to eight disk drives, of which any number can be RAMDisks, standard Atari floppies, or hard drives. You can change the logical drive number of any drive, or swap drive numbers of two drives. Hard drives can be divided ("partitioned") into several separate sections, each seen as an independent disk drive.

The BB and MIO both offer a serial (modem) port, a parallel (printer) port, and an SASI/SCSI (hard drive) expansion port. This last port will allow industry standard SASI or SCSI hard disk controllers to be attached using a 50 position ribbon cable.

BUILDING A HARD DRIVE SYSTEM

An 8-bit Atari hard drive setup will include several parts: the HOST (probably an MIO or BB), a CONTROLLER, a HARD DRIVE, and some kind of case and power supply for it all. Other than the host, all the other parts will be usable on other computers (including the ST) if you later change systems (shame on you). Total costs can be as low as under $400 with careful shopping. And you won't really need more than a single floppy anymore, perhaps freeing up some hardware you can sell. Hard drives are available in a wide range of sizes, from 5 megabytes to hundreds of megs. The capacity of your drive is up to you and your budget, but for the relatively small 8-bit applications, even a (very cheap!) 10 meg drive will hold an incredible array of software. You can also easily add a second drive later.

When buying your hard disk controller, make sure it matches your hard drive. Controllers are available for Modified FM (MFM) and Run Length Limited (RLL) type drives. RLL will provide 50% more disk space at approximately the same cost, and are usually a bit faster. Don't use MFM drives with an RLL controller, as the increased data density of the RLL system will likely exceed the capability of the MFM drive, leading to data loss sooner or later. You can usually use an RLL drive on an MFM controller with no harm, but with only two-thirds of the rated drive capacity.

Another option would be to get a drive which has the controller built right on it. These drives tend to be a bit faster and more expensive. These are designated as "SCSI drives" and have the 50 position ribbon connector right on the drive.

A wide variety of cases (most with power supplies) are on the market, with the most popular being the external "shoebox" type formerly used on the original PCs.

To be able to access all of this disk space, you will need a DOS which will support hard drives--Atari's own DOS systems haven't got the

capacity. Both SpartaDOS (including the cart-based SDX, both sold by ICD, Inc.) and MyDOS 4.50 (included with the BB) fill this need very nicely. Both support drives with partitions as large as 16 megabytes.

Both ICD and CSS offer prepackaged hard drive systems to simplify the task of adding a hard drive to your 8-bit. Call CSS or ICD to check their current stock, pricing, or for additional information.

4545. Atari 850 -> parallel printer cable needed (buy/borrow/trade)

Newsgroup: comp.sys.atari.8bit
Date: 1991-10-15 17:02:13 UTC
From: garsod@aix.rpi.edu
Message-ID: <d_bp=fm@rpi.edu>
Source record: 113548

I need a printer cable for my Atari 850 interface.

I am willing to trade parts (keyboards, RANA 1000 floppy drives in various states of disrepair, atari 800 cases, motherboards, etc), buy, or just borrow a cable for a few months.

A lead to a manufacturer/retailer who can sell me one would also be useful.

Thanks!

Hi! I'm an Atari ST owner that's trying to learn true hacking. I figure that I should start with a small computer and work my way up. I've found a company that sells working atari 400's extremely cheap. (20 each) What I want to do is first to learn assembly language (and binary if I can/must) and I may not rely heavily on the OS in rom.. Anyway, I'd like to also hook two 400's together with some wire and have them talk to each other (no incredibly high speed needed, just whatever would be simplest) I'd like to do this so I could write two player games and such between them. Anyway, I need to know what I need to do this.. Does an assembly language program come with the 400? Whare could I get a decent one cheap, if not? Can the 400 use any of Atari's cassette drives? How much storage does a cassette drive have? Where can I get a book on assembly language for the Atari 400? I want to keep the cost as minimal as possible. I don't mind if it takes a while for the programs to load or anything. I just want to be able to do all the neat hardware and software hacking that the great hackers used to do. Hopefully, if I can get my way with the Atari 400's, then I'll have confidence and the ability to work inside other systems.. oh, and if I get the 400's, what are the cheapest monitors I can get for them? the lowest I've seen is 75 for monochrome monitors.. Can 400's use TV's? Thanks 8-bit hackers!!

4550. Re: SIO2PC and duplicating old 8-bit programs

Newsgroup: comp.sys.atari.8bit
Date: 1991-10-16 15:53:20 UTC
From: Amos.Jackson@tdkt.kksys.mn.org
Message-ID: <687673353.0@tdkt.kksys.mn>
Source record: 113416

Responding to your question about copying old 8-bit files, I can only give you responses I've received from companies to used to produce such products:

My problem was thhat I had a disk fry on me about three years ago. I wrotethe company who sold the program to try to purchase another copy. This was the reply I received:

In answer to your question as to will we continue to produce software for the Atari 8-bit line, the only answer I can give is no. As far as we are concerned we (Eypx) don't feel that there is a marketplace for the Atari 8-bit line anymore. We also don't have anymore Atari 8-bit software in stock. We feel that the Atari 8-bit user can obtain old software from almost any Atari 8-bit bbs, and we welcome you to do the same. There's no market, we don't sale or produce software for the machine, therefore we won't be loosing any money.

Some still feel that in obtaining files in this mannar, it's pirating., but the companies themselves could not care less because frankly, they don't care. I also find that those that are continuing to use the label 'pirate' as pertaining to Atari 8-bit files are also trying to make a buck off of these files. With the exception of ONE (let me repeat) ONE usergroup in the Minneapolis/St. Paul area, there is NO way of obtaining Atari software. There are less than a handful of SMALL business that still support the Atari 8-bit (thank-goodness), but the majority of BETTER THAN NORMAL software for the Atari 8-bit just cannot be found except by obtaining a cracked copy.

As for myself, if I can buy Atari software, I do, BUT if I can't, I have no problems with getting a cracked copy. I have thousands of dollars invested in my 8-bit system(s), one of them has the capability of storing 87.6 megs of stuff (I also offer that system to the public in the mannar of running a bbs). If I have to choose between purchase or copying, I will purchase IF (repeat) IF the software is available to purchase. If the software CANNOT be purchased and I must obtain a cracked copy or do without, I'm going after the cracked copy. I strongly feel that after all of the support I've given to the 8-bit line, that I SHOULD NOT have to go without because of a lack of company support.

I welcome anyone else who has a opinion to interject. The resopnse that I received from the company mentioned above is the same response I've received from other companies that no longer support the Atari 8-bit.

I agree with your statement. I'm not sure how many others do. I do run a bbs (Warp 10 BBS - Running BBS Express Professional + v. 3.1c - 612-778-9034 - 3/2400 baud). I have hundreds and hundreds of files online for the 8-bit user and room for more. I stated my feelings in a previous message so I won't get into them here. I will add to those statements that there ARE some programs that shouldn't be copied and passed out. BBS Express PRO is one of them. The company that produces this bbs software (K Products) is going strong and comes out with new upgrades on a regular basis, and the only way to show them that there is still STRONG support that exists for their products is by not pirating them. If companies like that one still exist, we need to support them by purchasing their products. If they don't exist, we need to get the materals we feel we need to enhance our investment in the 8-bit.
Amos Jackson

I have 4 Atari 8-bits (although two of them don't get much use). They are the 400, 800, 800XL (upgraded to 1 MEG of RAM), and a 130XE (Upgraded to 320K RAM). I have had NO problems with the 800XL or the 130XE running any carts or older Atari 8-bit software. As stated by another user of the net, a translator is available for programs that are "catered" to the 400/800 line. I use ultrafix for this purpose. BTW: The two machines that are basicly stored in the closet are the 400 and the 800. I prefer the XL or the XE.

I liked your message except when refering to SpartaDOS.

I am a dedicated SpartaDOS user. I have about 10 versions of this DOS, including the SpartaDOS X cart. I have had NO problems running software with SpartaDOS. Don't get me wrong, not knocking MyDOS at all, but those features you mentioned about SpartaDOS include features that will allow almost all software to run with it. The ONLY program I've found to date that won't run under SpartaDOS is Millipede. Everything else I've encountered will run under it. I've even used SpartaDOS to "convert" a AtariDOS 2.5 disk to run under ultraspeed with a US Doubler 1050 in read AND write mode.

I feel that ICD has GREAT easy to use products. I've owned a MIO for three years, and have NEVER had any problems with it. I believe there is only one users that I'm aware of that has a Black Box. I know of 5 correction - 6 others in this area that own MIO's. Three on bbs' that go 24 hours a day, 7 days a week, including mine. Only one had to go through repairs. No problems with the others. Personally, I've seen the black box, and my preference is with the MIO. Sorry, I just don't think it was the product, but something the user wasn't doing right.

Well, I certainly would not want to use a 400 for this purpose. For RUNNING your projects, sure... but for developing software, I would much prefer the keyboard of an 800.

The guy who developed NASTY (an ST to 8-bit interface), if I remember correctly, mentioned that he writes and assembles 6502 code on his ST, then simply transfers it to the 8 bit via this link. This would be a nice setup; maybe you could try this?

I always thought that you would need some kinda hard drive
controller board with the MIO and hard drive? I went out and
had to purchase an adaptec 5500 (Which is a 4 port mfm controller!)
for my setup... Im at the stage of the game where I have the MIO
the hard drive, all of the cables...an AT case I just got...
and I have spartados x32d.dos...
Heres a few additions to your list..
1) you need an MIO OR!! Black box.. and if you want an MIO youd better
hurry as ICD isnt making more!
2) You can use MFM, RLL hard drives for your 8 bit, but you need the correct
controller board for it.. once you decide on RLL or MFM you cannot change
unless you change the controller board (I think!)
3) case is easily located.. Just get an AT case..
4) Sparta is preferable, but I think Mydos will also work with a hard drive
setup.. Sparta has a lot of utilities for hard drives, and for the MIO, but
I dont rule out that some people use Mydos with a similar setup without
difficulty..

Hope this helps.

I think you can do it via a null modem too though ive never attempted it.
MIOs and Black boxes supposedly let one do 9600 baud without a problem.
Not bad for an 8 bit!

4567. HDD's and controllers

Newsgroup: comp.sys.atari.8bit
Date: 1991-10-17 14:09:22 UTC
From: smb@cs.purdue.EDU
Message-ID: <16594@ector.cs.purdue.edu>
Source record: 113412

>I always thought that you would need some kinda hard drive
>controller board with the MIO and hard drive?

Ok, time for a quick lesson in hard disk drive technology/terminology.
There are several types of hard drives available. Most (all?) are
really just variations of the first two types. These types are:

MFM - Modified FM -- also known as ST506 (after the Seagate drive)
many IBM PC's use these
RLL - Run Length Limited encoding -- similar to an MFM drive but
they use a different format on the media to increase density
again, many IBM PC's use these

Other (common) types:

SASI - Shuggart Associates Systems Interconnect -- this is an MFM
or RLL drive with a disk controller card built in that works
with a SASI host adaptor (ie., an MIO or BB) -- these tend to
be harder to find

SCSI - Small Computer Systems Interconnect -- similar to SASI, this
is an MFM or RLL drive with a disk controller card built in --
as with the SASI drives, these require a host adaptor (such as
the MIO or BB)

SDI - ??? -- I believe that Digital Equipment Corporation (DEC)
developed this standard -- generally this is seen in larger
computers

ESDI - Extended SDI -- again, primarily used in larger computers
but some host adaptors are beginning to appear for smaller
machines (such as PC's, Amigas, etc.)

Now, the burning question: What can I use on my 8-bit Atari?
Ok, assuming you have an MIO or a BB, you have a host adaptor that can
handle SASI or SCSI disks (I don't think you can mix two different
types at one time). You can buy any of the following setups and it
should work:

an MFM drive and a SCSI (or SASI) disk controller for it --
advantage: most SCSI/SASI disk controllers can handle more than
one attached drive
disadvantage: the controller cards are getting harder to find
as more and more drives come with embedded controllers

an RLL drive and a SCSI (or SASI) disk controller for it --
advantage: same as for MFM drive at generally higher densities

disadvantage: same as for MFM drive

a drive with an embedded SCSI/SASI controller --
advantage: readily available and you _KNOW_ that the drive
and controller will cooperate with each other
disadvantage: you generally can't add more drives to the
controller card (though you can buy more drives with their
own controllers)

possibly a drive with and embedded SDI or ESDI controller and a
SCSI-to-[E]SDI adaptor --
advantage: none, really, unless you can get and excellent
deal on a drive
disadvantage: the SCSI-to-[E]SDI adaptor (if you can find
one) is probably going to be damned expensive

The only real advantage that having separate SCSI controllers has is
that the SCSI standard limits you to having at most 8 SCSI units on
the bus (where a unit is a controller or host adaptor) but allows
each unit to control up to 8 devices (ie., disk and tape drives). So,
theoretically, you could have 56 hard disk drives attached to your
8-bit computer at one time. However, the MIO/BB and SpartaDos/MyDos
are likely going to have problems with more than 8 drives/partitions
total.

Given the price of a drive with an embedded SCSI controller and the
limits of the 8-bit's ability to address drives, I would probably just
buy a drive with a SCSI controller built in and not hassle with trying
to find a controller that will work with it. By the way, before going
out and buying a huge HDD, remember the limits of what you can access.
SpartaDos (and MyDos?) can only access partitions of at most 16M. If
you went all hard drives (and never used a floppy drive or ram disk)
you could effectively only access 16M * 8 drives for a total of 128M.
Anything over that is probably wasted.

Scott

Message-ID: <1991Oct17.143301.15992@magnus.acs.ohio-state.edu>
Source record: 113413

First, the fix for the P:R: Connection is basically an alternate "R:"
handler; it replaces the standard one booted from ROM. So to use the new
handler, simply replace the 850 handler with the PRCON.SYS handler; if
the 850 handler is a part of the terminal/BBS program in question, you
must first remove it before adding PRCON.SYS.
Someone asked about a monitor on an Atari 4oo. If memory serves, the
4oo lacks any monitor output; ONLY a television may be used. There is
a modification which allows monitor output, however.
On another subject, someone was comparing SpartaDOS vs MyDOS in a
previous article. I have used MyDos 4.50 successfully on two hard
drive systems, a Corvus and a BlackBox configuration with an 80mb Ehman
drive (imbedded controller). I have found MyDos to be much more reliable
than SpartaDOS. It is much easier to fix things when they go wrong, also.
I can only recall several MyDos disk crashes over approximately 8
years of continuous BBS operations; in contrast, SpartaDOS has
scrozzled directories on many occasions. I have not tried the
cartridge version but I can't recommend the disk based version 3.2
to anyone. Granted, it has a vastly more powerful set of utilities
and a command line interpreter; time-date stamping is wonderful too.
But it simply isn't as reliable, IMO, as MyDos.
When you have 1ooo files or more on a hard drive it isn't too pleasant
to find garbage characters strewn about in the directory.

Well Shawn I don't know much about the rest of your questions but I
do know that you can use a TV perfectly on the 400. As it has only a
40 column screen you can read it quite clearly. Good luck with the rest
of your quest.

4571. Re: (none)[Hard drives]

Newsgroup: comp.sys.atari.8bit
Date: 1991-10-17 22:10:19 UTC
From: bmarcum@world.std.com
Message-ID: <BDGLL9.3A5@world.std.com>
Source record: 113422

You can hook a SCSI hard drive directly to the MIO or the Black Box without a separate controller board. However, nowadays many SCSI drives only allow 512 byte sectors. The Black Box will work with these drives, while the MIO requires 256 bytes per sector. So, if you have an MIO it's best to use MFM or RLL drives with an appropriate controller.

This may not work. I have recently learned that SpartaDOS X has a
'device' command, which apparently loads driver files named FOO.SYS
which look like they're in some special format. You say DEVICE FOO to
load these special drivers. Under disk Spartados and MyDOS I
attempted to load the XEP80 driver XEP80.SYS every way I could think
of, and consistently got the 'not a binary file' type of response.

Any more definitive information would be welcome - I need to
disassemble XEP80.SYS.

Which brings up another point - my infamous emacs-subset text editor
(EMAX) for the XEP80 still needs beta testing. I have the doc and
uuencoded binary online here, and can send it immediately to anyone
wanting to try it. BTW, if you haven't already surmised, it doesn't
run under SDX due to a driver problem, but will work under [at least]
disk-based SpartaDOS, MyDOS, 2.5 and DOSXE.

-Stan

4575. Terminal Programs

Newsgroup: comp.sys.atari.8bit
Date: 1991-10-18 18:13:37 UTC

Message-ID: <1991Oct18.181337.13440@cis.ohio-state.edu>
Source record: 113425

This is the first time I have posted to the net, so please bear with me.

I have connected to the ATARI.ARCHIVE.UMICH.EDU and downloaded several terminal programs to my terminal, un-arced them, and then downloaded them to my Atari at home.

I am using an Atari 800XL (with rambo), Avatex 1200 modem, and SpartaDos. Of all the emulators I have downloaded (including AnsiTerm, vt52, vt10sqr and Kermit) I cannot get any of them to connect to the mainframe. None of them seem to affect my modem at all, even after I have loaded RS232.SYS from the P:R: Connection disk.

Any help with getting these programs to work would help me out a lot.

I've definitely used 9600 baud without a problem, folks. Just with a P:R:
connection and a null modem to my PC. Don't see what all the problems are
about.

4577. Need Xformer Help - Xfering from ST to 8-bit

Newsgroup: comp.sys.atari.8bit
Date: 1991-10-19 01:21:53 UTC
From: ddavis@osiris
Message-ID: <1991Oct19.012153.9173@ux1.cso.uiuc.edu>
Source record: 113429

Could someone provide advice on moving files from the ST to a 5 1/4" 8-bit formatted disk? I have the ST Xformer software and cable, but am having difficulty moving the files to 8-bit format. Here's what I'd like to do:

(1) download 8-bit files from a BBS with the ST;

(2) move the 8-bit files from the ST to the 8-bit 5 1/4" disks.

I've tried to use the STXFXP program to move the files without success. I tried copying to an "empty" *.xfd file but keep getting not enough room errors.

Is the original manual available by ftp? That would probably be a help :-)

Any help would be greatly appreciated.

dave

Yes. ICD is trying to liquidate their 8bit line, even to selling the rights
to various pieces of hardware. This started a few months ago, so I'm not
sure what's left. I tried for a memory expansion board for my 800XL, but no
go.

To hook them up, just use an SIO cable. However to get them to TALK to each
other, you will probably need a special device handler for at least one
of them. Don't know the specifics of that.

>I'd like to do this so I could write two player games and such between
>them. Anyway, I need to know what I need to do this.. Does an assembly
>language program come with the 400?

Not that I know of. The most basic of assemblers is the the assembler/editor
cartridge, but it isn't too great with advanced tasks. MAC65 seems to be
the best choice for assembly language, but you will probably need a disk drive.

>Whare could I get a decent one cheap,
>if not?
Used stuff seems to be cheapest, but the seller may not be reliable.

>Can the 400 use any of Atari's cassette drives? How much storage
>does a cassette drive have?
All Atari 8bits can use cassette drives. I never measured the size exactly,
but a 90 min. tape is slightly larger than 1 formatted, SSSD disk.

>Where can I get a book on assembly language
>for the Atari 400?

Try a used book store or another user. I seriously doubt any of these books
are still around.

>I want to keep the cost as minimal as possible. I

Good luck.

>oh, and if I get the 400's, what are the cheapest
>monitors I can get for them? the lowest I've seen is 75 for monochrome
>monitors.. Can 400's use TV's? Thanks 8-bit hackers!!

As long as the wire on the back of the computer is still intact, you can hook it up to a TV. You will also need a switchbox (the computer plugs into the box, the box to the TV's antenna jacks). If they don't provide you with this box, you can get one from your local Radio Shack. I think they call it a "Video Game Connector" or something like that, and it will plug into the 75ohm or 300ohm connector on your TV. You can then switch between your computer and antenna/cable. It's small -- about 2.5" by 1.5" by .5". Older ones may be larger, and not have the 75ohm connector, but that is a minor problem.
Note that the RF wire on the computer has an RCA type jack, but it does NOT work with the RCA type ports on, say, your VCR or stereo.

That's paiiiinfuuuullllllly sllloooooowwww!

Well, the cassette drive transfers data at a default of 600 baud, right?

That would be 75 bytes per second (including control bytes), or 4500 bytes
per minute. (2 minutes to load a simple 8K game!!!)

So, a 90 minute tape could theoretically hold 90 x 4500 = 405000 bytes,
about 4 SSSD diskettes. But due to inter-record gaps and such, the
transfer rate in reality is probably more like 50 cps. This is pitiful
as a data storage medium and should be your last resort. The cassette
drive is a classic relic of early home computing. :)

4581. ATARI CX85 keypad

Newsgroup: comp.sys.atari.8bit
Date: 1991-10-20 02:03:38 UTC
From: wa2ise@cbnewsb.cb.att.com
Message-ID: <1991Oct20.020338.8079@cbfsb.att.com>
Source record: 113435

Picked up at a amateur radio hamfest an Atari CX85. It is a small box with numeric keys in the middle, a - and +enter keys on the right, and Escape, no, delete, and yes keys on the left. And this box has a cord with a connector that looks like that on on an Atari joystick. Will this thing be useful on an 800? How does one write software to make use of this box? What software exists that understands this box and where to get it?

Thanks in advance

You didn't actually say whether you had an 8-bit or whether you just
wanted to transfer the files to a 5.25 disk only. If you have an 8-bit
then it is extremely easy to transfer files from the ST to the 8-bit
with a null modem cable, Bobterm and Flash, if not then I can't help
you as I'm not familiar with the XFormer software.

Source record: 113442

When I wanted a memory expansion board, I went through Newell Industries for mine. I went for the 1 meg upgrade ($49.95). They also have 256K upgrades available for $29;95. The chips for the 1 meg upgrade are $44.00 as of 2/12/91 and 256k chips are $12.00. This one meg upgrade can be expanded to 4 megs in the future if I wish, but expanding the unit (an XL) to 4 megs would cost alot in terms of compatability. Still, it would be nice for those of us running BBS', but the price of the chips are $344.00 as of 2/12/91.

This morning I posted the latest version of SIO2PC to this newsgroup and was immediately attacked by a fellow at a commercial site about the extremely excessive volume of the 138K .ZIP file. I don't think this was such a God-awful thing to do, but I instructed my organization to cancel the relevant articles. This newsgroup barely has any articles and uses very little bandwidth. In comparison, newsgroups like alt.sex.pictures typically see several MEGABYTES of traffic every day!!

I have submitted the package to atari.archive.umich.edu and have been notified that it was received.

For those without access to this site, you can either use their mail-server bart@atari.archive.umich.edu, or I will mail it directly to you.

I just finished building the interface, and it works beautifully. I highly recommend this project, and I'm willing to answer any questions you may have.

My personal reply bounced so here goes:

In article <398@itexjct.UUCP> you write:
>1: How can I read/write dos 2.0 diskettes with an MSDOS machine?

As far as I know, you can only r/w double density disks. You need to
either get the ICD Ultraspeed Doubler (US Doubler) which is a 1050
hardware upgrade you install yourself, or get an XF551 drive or a
third party drive. 1050 enhanced density won't work.

Another possibility is to use RS232 to connect the machines together,
and a terminal emulator program such as kermit or bobterm to transfer
files.

>2: What is Sparta-Dos?

This is a third-party DOS made by ICD. It lives in RAM under your
800XL's ROM, so you don't need to keep swapping DUP.SYS in and out.

A similar DOS is the SpartaDOS X (SDX) cartridge, also from ICD. The
cartridge contains all OS functionality and has lots of utilities
built in.

The US Doubler, SpartaDOS and SDX are available mail order, at least
in the US.

>3: How serious are the C compilers I found on atari.archive.umich.edu ?

I have used CC65 a little and barring little problems have had it
work. I know for a fact that some people have used it a lot.

It's actually pretty easy. Get the specifics on dos 2.0, such things as
How many sectors per track, where the directory track is, how many tracks
there are. As far as I know, the disks are single sided, single density so
you have to keep this in mind when reading from them.

The IBM 360k disk drive is very usefull. By communicating directly with the
Bios rom, you can set the specifics so almost any type of disk can be read.
The trick is to program a formatting routine so the data you get in is
comprehensible. Knowlege of 80x86 assembly is necessary for the operation.

4590. Re: Tape to disk conversion program

Newsgroup: comp.sys.atari.8bit
Date: 1991-10-21 21:04:39 UTC
From: Chris_F_Chiesa@cup.portal.com
Message-ID: <49016@cup.portal.com>
Source record: 113443

Tape-to-disk programs for the Atari 8-bit a) exist, b) were plentiful when disk drives were first becoming available to supersede the early, nearly ubiquitous cassette-only systems (back about '80 or so), and c) are probably scarce as hen's teeth today.

However, I have one on a disk that I know of, and can try to upload it to Portal to mail to you in UUencoded form. Can you handle that? Anybody else want it? (I.e. if and when I upload it, should I e-mail it just to the one requestor, or post it for general consumption? I still have MY tape drive although I rarely use it, so perhaps you do too...)

Finally, if you know a little bit of 6502 assembly and a little bit of Atari internals (i.e. how to do I/O), a tape-to-disk conversion program is almost trivial to write...

Hope this helps...

Hello!

I've just noticed this thread and can't find who started it, but
it seems to be talking about connecting Atari 400's (or others)
together. Chuck Steinman (of DataQue fame) and I are working on
just such a program. It will be an interactive multi-player game
similar to Midi-Maze. It would be played with up to eight users
who would connect their SIO cables together. We're hoping to
get the thing ready for the Chicago Atari Computerfest, so stay
tuned.

Dave, you can copy files DIRECTLY from the ST disk to the 8-bit disk one at a time. What you do is boot up Xformer, go into Atari DOS, and use the COPY command to copy the file. Use the ST file as your source, and the 8-bit file you want to copy it to as the destination. Make sure your 8-bit disk drive is plugged in and turned on. For example, if you have a file on your ST disk called "README.TXT" and you want to copy it to the 8-bit disk, you would COPY F:README.TXT,D:README.TXT. NOTE: this only applies to the ST version of Xformer.

The ST Xformer manual is not available online, but ST Xformer 2.55 disks and manuals are available from me for $15.

Well....I think the problem is that the main frame is running
at 7 bits 1 stop bit even parity! I cannot log onto the main frame
here either because of this...several keys do not work and most appear
to be reasigned or somthing!
The answer?
HAH! NO-ONE has been able to get this to work for me. I even talked
to Bob Puff himself and his sugestion for fixing my problem (since I am
writing a term program that I thought could handle 7-1-E) with my 850
inteface seemed logical...yet..it did not work. I am still waiting
for a reply. Apparently the Atari and its hardware have problems with
going above true 9600baud and doing anything other that 8bits.

So anyone out there please solve this problem and PLEASE test it first!

Thank you.

My guess is this 'adapter' is just the 2600 chip set, from which the
5200 just takes the video and audio and routs them through. The price
of the adapter was on par with the newer cost-reduced 2600 from a few
years ago, and I was told by someone at Atari (an engineer) that the
video chip of the 2600 is very different from that of the 5200 (which
I think is the original 400/800 one.)

If you want to run 2600 games, just get a 2600 - I bet you could get
a used one real cheap out of a local buy/sell mag (if you have one in
your area.) And probably 50 carts. too.

Alternatively, I noticed 7800s for sale at the local Child World.
They are automatically 2600-compatible.

-Stan

4599. Re: Commodore 1702/1802 monitor

Newsgroup: comp.sys.atari.8bit

I have just purchased two commodore 1702 monitors for $60 each.
$60 is still alot for a composite monitor, so I suspect you could
get one even cheeper.

I use one for my 65XE, and one is hooked up to my A/V receiver as
a very clear television monitor.

The chroma/luma inputs might be useful for hooking one up to a Su
per VHS VCR, but I havnt tried that yet.
The SVHS format can produce video comperable to Laserdisk.

I once saw a cart to disk system back in '85 in a Compute! mag.
The system was Copy Cart, and put carts on disk and menued them.
But the ad stated it would work on any cart made up to the year 1
985. The carts back then were mostly 16K. But I would like to fin
d a system to use for the newer XEGS carts.

Anyone know where to get one?

Thanks.

The 2600 adapter, as I understand it, was actually a complete 2600 machine
that used the 5200's power supply and rf modulator. Since the XL/XE cartridge
port doesn't include video/audio inputs, it wouldn't be easy to adapt.

Hmm, funny you should mention the 5200.. Discussing the Atari line with some friends, we noticed how short-lived the 5200 was. Even today, you can still find 2600 and 7800 cartridges, but hardly ever a 5200 cartridge. For example, I just bought Gravitar for my old 2600 (still good for some of the classic arcade games and shoot em ups) and in another store I saw a double dragon 2 for the 7800 with graphics comparable to a nintendo of sega. But I haven't seen a 5200 for YEARS. Anyone knopw what happened? Was it just a case of being in the middle of the road and getting run over?

Well, I can honestly tell you the actual rate, if he would sell it to a
used hardware purchaser is about $35 - $40. But, if its a friend then I
would say give him about $50. Becuase a dealer wont sell it for less then
$65 - $70.

Regarding Cartridge to disk systems, I have seen (and have)
several small programs that claim to do that, although I wouldn't call it a
"system". I personally have never gotten any of them to work, and it
appears that many of the cartridges are designed to prevent that sort of
thing. Even considering the older, relatively easy carts to copy, the
programs require a lot of hacking and are not user friendly. A good
knowledge of the operating system involved with cartriges would be helpfull,
which I do not have.

I'll never forget the time I tried to copy a certain game from tape to disk.
What a hastle!

I'd highly reccommend this option. The 7800 is a really nice little system--in many ways the graphics are superior to that of the 800. The sound is the same as the 2600 though. I picked one up at Toys 'R Us, brand new and in the box, with two joysticks and a Pole Position II cart for only $34.98. You can get the same deal for only $39.99 from Telegames USA.

The interesting thing about the 7800 is that Atari is still supporting it. A whole slew of new games was released in the past year. Are any games coming out for the XEGS?

If you are using bobterm and sometimes some keys wont work, switch
the emulation mode off of VT520 or VT52e to ascii. I don't know why, but
when you have either of these VT things on, it won't work correctly with
most boards. I guess they are not a true VT emulation??? I dunno, but
that's what I ran into and what I
did to solve the problem...:)

Hey, did yu ever see an Asteroids game for that system? I've seen adds
in old Electronic Gaming magazines for it, but I haven't been able to find
it.
The 5200 and the 800xl computers are the same thing! I don't see why it
would be hard to port over a game fom
it. As you know, most of the games for the 5200 have already been done so.
But if you still want to try it, you first would either have to make a
cable that would connect the cartridge to the 8-bit, via bus port or
cartridge port. Either that or get a rom read , but those are really
expensive!

4610. How can I fix my 1050?

Newsgroup: comp.sys.atari.8bit

Greetings to all.

I've been having trouble with my 1050 disk drive for some time now, and a few hours ago I had no choice but to open it up to try to fix it myself. In doing so, I decided to unscrew the track 0 sensor and clean the space between the transmitter and detector (I guess that's all it is).

However, when I was screwing the sensor back in place, I realized that there was more than one position to put it back in. The reason is that the two holes for the screws in the sensor casing are *oval*, which allows for a couple of millimeters of play. Unfortunately, I have no idea how you're supposed to figure out exactly where the right position is!

When I first put the sensor back in place, the drive was unable to read *any* sectors back. Then I slid it over a bit, and thankfully it was able to read some of the sectors near the center of the disk. After playing around with it a bit more, I can get it to read almost the whole disk properly.

When I try to read in a sequence of sectors starting at sector 500 (remember that there are 720 sectors in all, on 40 tracks), I can see the head step toward the center of the disk track by track - until it gets to the end of track 37, when it actually steps *back* by one track (to 36)! Then it fails to read the sector, and the head goes back to track 0 to reorient itself, and it goes out to track 38 as it should. Does anyone have any idea why it does this? What do you do to fix this?

The other thing I'm worried about now is *writing* to disks. While my drive might be able to write sectors (I haven't tried yet), it is likely that no other disk drive will be able to *read* these sectors (except for my drive).

So what I'd like to know is, is a head alignment based solely on the position of the track 0 sensor? Do you need an oscilloscope to 'center' the sensor? Is there hope for someone without an oscilloscope to do this? Any references to technical documents, personal suggestions, helpful hints, or any comments, are welcome (and thanks in advance!).

Hmm.. I just saw Toys are us selling one of those monitors for 300
bucks!! Geesh.. They were selling a commie XT for 600 bucks (no HD even)
and that was with no monitor or pheripals, except for two 360k drives!!!
Anyway, I'd DEFINITELY be interested in one of these monitors, even if
though I may not use them for thwe ataris after all (I've had alot of
encouragement to stick with the 16 bit to learn assembly)... I'd really
like to get one to use as a Video monitor.. Hoe do they hook up to the
vcr, and can I get a tuner that converts it into a TV (I know a vcr would
probably work, but I'm short on cash..)

There was an article in ANALOG Computing, ever so long ago, which discussed the few differences between the 5200 and 800. Most of them were fairly insignificant. The 2600 and 7800, however, are completely different beasts.

If anyone would like I could dig up the article. BTW, I just received a flyer from a company called MARS Merchandising which is selling 5200 carts without boxes or instructions for $12 apiece, if anyone is interested.

Source record: 113468

Okay, all you have to do to use a monitor as a tv is connect the
video out to the video in of the monitor.In this case, the video
will be in composite form.
If you must, use the audio out and connect it to the monitor. I p
ersonally use a y-connector to hook the audio to my stereo, but i
f you have a stereo vcr, it has seperate l and r outs to hook to
the vcr/aux input of a stereo.Most a/v receivers can also dub and
use the vcr as a high quality audio-only device.
There used to be more then a few add-on tuners for monitors, but
the onslought of a/v receivers and vcr's,plus most newer monitors
using inputs other then composite,have made it a rather dry marke
t, but I am sure you can find a used one somewhere.

4620. RS232 port questions...

Newsgroup: comp.sys.atari.8bit
Date: 1991-10-28 01:08:16 UTC
From: spam@iastate.edu
Message-ID: <1991Oct28.010816.19572@news.iastate.edu>
Source record: 113473

for experimental use, I'm connecting one of my ataris to a terminal via a P:R:connection, and I'm trying to write a program that will send data back and forth between the machines. Right now, I have to following program:

```
5 OPEN #2,4,0,"K:" :REM OPEN KEYBOARD IOCB
10 OPEN #1,12,0,"R1:" :REM OPEN RS232 IOCB
20 XIO 36,#1,14,0,"R1:" :REM SET RS232 TO 9.6K BAUD
30 XIO 38,#1,32,0,"R1:" :REM SET NO TRANSLATION
40 XIO 40,#1,0,0,"R1:" :REM SET CONCURRENT MODE ON
50 STATUS #1,DUMMY :REM CHECK FOR DATA FROM RS232
60 INCHARS=PEEK(747) :REM SIZE OF RS232 INPUT BUFFER
70 OUTCHARS=PEEK(749) :REM SIZE OF RS232 OUTPUT BUFFER
80 IF INCHARS>0 THEN GOSUB 200 :REM IF DATA IS WAITING THEN 200
50 STATUS #1,DUMMY :REM CHECK FOR DATA FROM KEYBOARD
60 INCHARS=PEEK(747) :REM SIZE OF KEYBOARD INPUT BUFFER
70 OUTCHARS=PEEK(749) :REM SIZE OF KEYBOARD OUTPUT BUFFER
80 IF INCHARS>0 THEN GOSUB 200 :REM IF DATA IS WAITING THEN 300
130 GOTO 50 :REM BASIC FLOW CONTROL CONSIDERED USELESS
200 GET #1,X :REM GET BYTE FROM RS232
210 PRINT CHR$(X) :REM PRINT BYTE TO SCREEN
220 PUT #1,X :REM SEND BYTE BACK. WOW! FULL DUPLEX!
230 RETURN :REM POP BACK TO MAIN
300 GET #2,X :REM GET BYTE FROM KEYBOARD
310 PRINT CHR$(X) :REM PRINT BYTE TO SCREEN
320 PUT #1,X :REM SEND BYTE BACK. FULL DUPLEX AGAIN
330 RETURN :REM POP BACK TO MAIN
```

Anyway, what I want this program to do is wait for a keyboard entry on either machine, print that entry on both machines (full duplex) and go back to waiting (sort of like a very primative chat program). What is *is* doing is *almost* that, but when I type a key on, say, the atari, it isn't processed until a key is pressed on the terminal, and vice-versa. I haven't done any work on the atari for about 4 years, and no BASIC for approximately the same length of time.

What I ultimately plan to use this for is something like a *simple* terminal server. Our university has an ISN data network, and I have a 9600 baud line into my apartment. I want to be able to dial up my port and select which of my machines I want to connect to remotely. I plan to replace the P:R: connection with an 850 interface, thereby giving me 4 serial ports, one to connect to the outside, and the other 3 to connect to 3 of my machines. So when I call up my port from a remote machine, I'll see a menu such as this:

```
services offered:
1: UNIX PC 3B1
```

2: MessyDOS
3: CP/M (yes! long live PIP!)

Enter choice:

By selecting one of the machines the Atari will echo all the data between the outside port and the target machine, thereby being a sort of 'machine server' to my remote terminal. I imagine I'd eventually be able to have multiple sessions open, one to each machine.

But that's far in the future. (at least a month, I suppose)

Anyway, I suppose this is the sort of thing I ought to do in a real language (Action, I imagine. I haven't used it, nor have I used C on an atari).
But in the meantime, can someone send me some simple BASIC routines that will allow for two way communication between the atari & an RS-232 device?

4621. RS232 questions

Newsgroup: comp.sys.atari.8bit
Date: 1991-10-28 02:11:53 UTC
From: spam@iastate.edu
Message-ID: <1991Oct28.021153.20655@news.iastate.edu>
Source record: 113474

for experimental use, I'm connecting one of my ataris to a terminal via a P:R:connection, and I'm trying to write a program that will send data back and forth between the machines. Right now, I have to following program:

```
5 OPEN #2,4,0,"K:" :REM OPEN KEYBOARD IOCB
10 OPEN #1,12,0,"R1:" :REM OPEN RS232 IOCB
20 XIO 36,#1,14,0,"R1:" :REM SET RS232 TO 9.6K BAUD
30 XIO 38,#1,32,0,"R1:" :REM SET NO TRANSLATION
40 XIO 40,#1,0,0,"R1:" :REM SET CONCURRENT MODE ON
50 STATUS #1,DUMMY :REM CHECK FOR DATA FROM RS232
60 INCHARS=PEEK(747) :REM SIZE OF RS232 INPUT BUFFER
70 OUTCHARS=PEEK(749) :REM SIZE OF RS232 OUTPUT BUFFER
80 IF INCHARS>0 THEN GOSUB 200 :REM IF RS232 DATA IS WAITING THEN 200
50 STATUS #1,DUMMY :REM CHECK FOR DATA FROM KEYBOARD
60 INCHARS=PEEK(747) :REM SIZE OF KEYBOARD INPUT BUFFER
70 OUTCHARS=PEEK(749) :REM SIZE OF KEYBOARD OUTPUT BUFFER
80 IF INCHARS>0 THEN GOSUB 200 :REM IF KEYBOARD DATA IS WAITING THEN 300
130 GOTO 50 :REM BASIC FLOW CONTROL CONSIDERED USELESS
200 GET #1,X :REM GET BYTE FROM RS232
210 PRINT CHR$(X) :REM PRINT BYTE TO SCREEN
220 PUT #1,X :REM SEND BYTE BACK. WOW! FULL DUPLEX!
230 RETURN :REM POP BACK TO MAIN
300 GET #2,X :REM GET BYTE FROM KEYBOARD
310 PRINT CHR$(X) :REM PRINT BYTE TO SCREEN
320 PUT #1,X :REM SEND BYTE BACK. FULL DUPLEX AGAIN
330 RETURN :REM POP BACK TO MAIN
```

Anyway, what I want this program to do is wait for a keyboard entry on either machine, print that entry on both machines (full duplex) and go back to waiting (sort of like a very primative chat program). What is *is* doing is *almost* that, but when I type a key on, say, the atari, it isn't processed until a key is pressed on the terminal, and vice-versa. I haven't done any work on the atari for about 4 years, and no BASIC for approximately the same length of time, so don't be surprised if it's something obvious....

What I ultimately plan to use this for is something like a *simple* terminal server. Our university has an ISN data network, and I have a 9600 baud line into my apartment. I want to be able to dial up my port and select which of my machines I want to connect to remotely. I plan to replace the P:R: connection with an 850 interface, thereby giving me 4 serial ports, one to connect to the outside, and the other 3 to connect to 3 of my machines. So when I call up my port from a remote machine, I'll see a menu such as this:

```
services offered:
1: UNIX PC 3B1
```

2: MessyDOS
3: CP/M

Enter choice:

By selecting one of the machines the Atari will echo all the data between the outside port and the target machine, thereby being a sort of 'machine server' to my remote terminal. I imagine I'd eventually be able to have multiple sessions open, one to each machine.

But that's far in the future. (at least a month, I suppose)

Anyway, I suppose this is the sort of thing I ought to do in a real language (Action, I imagine. I haven't used it, nor have I used C on an atari).
But in the meantime, can someone send me some simple BASIC routines that will allow for two way communication between the atari & an RS-232 device?

4622. Re: Cartridge Backup

Newsgroup: comp.sys.atari.8bit
Date: 1991-10-28 05:42:04 UTC
From: Chris_F_Chiesa@cup.portal.com
Message-ID: <49328@cup.portal.com>
Source record: 113477

A friend of mine (hi Protege!) and I spent a couple of interesting weeks back in '86 or '87 or so, hacking out the details of copying a cart to disk, just for the instructional value of the exercise (i.e. we owned the carts, both before and after the successful disk backup). I can state from experience that there is often a LOT more involved than simply copying the data from cartridge memory space to a disk file!

For ALL carts, one must take into account that the format of the load-and-go information is different for a cart than for a disk file. Okay, we translated from one format to another. This was actually sufficient in some cases, for example Atari BASIC.

Some carts still refused to run; it turned out that they contained code which specifically "rewrote" parts of itself, such that if the program were executed from RAM (i.e. after being read in from disk) it would fail/crash/lock up, whereas if run from ROM the changes had no effect and the program would run normally. It was a tedious process tracking these down and fixing them; we got CENTIPEDE to work, but never finished (as I recall) the process with ASTEROIDS.

Most carts produced after about 1982 are 16K and larger. This leads to all manner of problems. Some carts simply "mapped into memory" as BOTH the A cart and the B cart, leaving not a whole heck of a lot of memory to simultaneously store one's cart-copying program and its display. This was solvable by writing really short and inflexible copying programs, tailor-written for one particular cart, instead of a large and versatile interactive one... Some carts, though, proved totally impossible for us to migrate to disk in a reasonable amount of time, because of some un-documented (as far as I've ever found) hardware features of the 8-bit computer! Namely, memory addresses $D500-$D5FF somehow contrive to "page flip" multiple banks of memory in certain cartridges; BATTLEZONE was one we looked at, which turned out to have 128K stuffed into it. We would have had to write some kind of loader which emulated all that bank-switching, assuming we could even FIND and TRAP all the references to the $D5xx address range at runtime, to even ATTEMPT to migrate BATTLEZONE to disk. I have since looked at BOUNTY BOB STRIKES BACK, which has two separate independent-ly bank-switched regions; in that one, the ROMs actually contain specific software jump vectors that bring in the appropriate pages, so it seemed as though it might be doable to emulate the bank-switching in this cart, but I ran into all sorts of nasty problems trying to bring chunks of code in from the disk during interrupt code -- which in the cart, of course had no problem bank-switching during an interrupt! So there are ways and ways of making carts impossible -- or at least damn difficult -- to diskify. I have to admire the ingenuity of some of the schemes!

Finally, the very process of getting a cart plugged in and a cart-copying environment running is a trick in itself. Natural behavior for a game cartridge is to take control of the system at boot time, but I found that I could load the "BUG/65" debugger from the early releases of "OS/A+" as high as it would go ($9200) in memory, code a tight loop that disabled interrupts and waited for me to press a console key then restore interrupts and exit, then execute that loop and, with all my fingers crossed, pop the desired cartridge into the (left) slot. It often took about six tries before I got the cart plugged in without locking the system, even so -- apparently the micro-timing of the order in which the cartridge contacts engage with the system, is crucial. Moreover, when I migrated to the XL I found that the XL revision of the OS computes a checksum of the entire cartridge space every fraction-of-a-second when there's a cart plugged in, and that simply popping a cartridge in and out -- never the SAFEST thing in the world, even just electrically speaking -- would ALWAYS banjax the system. Fortunately, I found that I could run the "Translator," restore the "old OS" and proceed as before. But it was a long process figuring this out.

I haven't hacked on a cartridge for a while now; these days I'm on a VAX! :-)

Hope this amused/entertained y'all!

C.Chiesa

Subject: Re: Trivia; Name of Atari
game ?
Amiano:
The game you are describing is Star
Raiders I!!! A great game when it first came out, and it was on cartridge,
so it should be fairly easy to find.
Also try to get a hold of Star Raiders II or the Last Star Fighter (these
two games are similar), the sequal is an outstanding game, and probably
the best ever for the 8-bit!

In article <1991Oct28.021153.20655@news.iastate.edu> which I ingeniously managed to post twice;

Well, I managed to answer my own question...seems taking the status of the k: device don't do too much. Soooo...I altered it to grab data from address 764, it works quite nicely now...

```
>90 STATUS #2,DUMMY :REM CHECK FOR DATA FROM KEYBOARD
>100 INCHARS=PEEK(747) :REM SIZE OF KEYBOARD INPUT BUFFER
```

is now

```
90 inchars=peek(764)
```

much better now

I do need to know how to send a BREAK, now...

4626. 1050 Drive Alignment

Newsgroup: comp.sys.atari.8bit
Date: 1991-10-28 15:46:21 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9110281546.AA06353@smithkline.com>
Source record: 113482

Hello people, I,m back on the Net again. Running with this stupid Mac SE my boss shoved down my throat, using VersaTerm-Pro. I much prefer the old XL under BobTerm or KERMIT 3.7, but I guess this progress (?).

To answer Jean Goulet's imquiry about the 1050: whoops, Jean, when you removed the track zero sensor, you blew it. I've replaced about a dozen of those sensors (thety are a common failure point in the 1050). But I *always* score the metal with a razor blade before removal of the old sensor in order to preserve the original alignment. Once the sensor is removed without a reference point, you have to start from scratch.

Alignment of a 1050 is no job for an amateur. Total alignment requires: track zero adjustment, azimuth adjustment, head alignment, RPM adjustment, & load pad pressure adjustment. It being Monday morning, my memory is a bit hazt here as
I haven't done this since last year, but I to the best of my recollection you definitely need a scope for track, azimuth, & head alignments. You will need the Dymek alignment disk ($25 from B&C, Best, or Jensen Tools), Atari 1050 alignment/test software (B&C or Best), & the Atari Preformatted Disk ($8, Best). You'LL need a decent scope- 10Mhz vert. bandwidth w/calibrated timebase. And of course you'll need the Atari 1050 Field Service Manual ($25 Best or B&C).Plus a voltmeter ,
a voltmeter, VOM, DMM, etc. Note that SAMS also publishes a ComputerFacts for the 1050 for ca. $25, but that manual is almost worthless.

Assuming you already have all the test gear, you are going to spend ca. $75 for the docs & software to re-align the drive. But a new drop-in pre-aligned mech can be purchased for $47 from American Technavision. For the average user, that's the simplest solution.

Even if you have all the test gear, docs, & software, there is no guarantee of success. Head alignment using the "cats eye" on the scope is especially tricky & requires a great deal of manual dexterity. I've attempted it myself on several occasions & achieved at best only partial success. If I had lots of time to practice (which I don't, since my real job & Current Notes consume 97% of my available time) I could eventually develop the required skill.

If you buy a plug-in mech, there is one thing you should watch out for. All the replacement mechs available today are Tandons. If you already have a Tandon mech, everything is cool. But if the mech in your 1050 is a World Storage type, you will probably experience problems when you replace it with a Tandon. Apperently each type of mech had its own ROM, & the ROMs aren't necessarily compatible
e. This ROM compatability issue is one of the items on my research agenda.

Oh yeah, I'm planning for a "Secrets of the 1050" article in the Jan-Feb issue of Current Notes, in my "Alchemist" column.

Provided Current Notes will still have an 8bit presence in 1992, that is.

I understand your message to mean that very few companies have taken the time to tell dedicated Atari users nation wide that the files are PD. If 8-bit users take the time to write these companies as I have, they would get the facts on the matter. I have taken the time to do so in trying to get software replaced and have received responses ranging from "Do what you have to do because we don't carry Atari 8-bit software anymore" to "We don't care at all about the Atari 8-bit and we're certain that copies a floating around on someone's bbs".

Source record: 113483

Does anyone know the legal status of programs from
magazines like _Analog_ and _Antic_? Are they public
domain and therefore probably available from a bbs somewhere?

** Here's an idea for an "ongoing project" for c.s.atari.8bit:

Everyone could check their own software collections and back-issues
of Atari mags for the names and possible addresses of software
companies. Someone could compile the list and we could organize
a concerted effort to contact some of these companies. Probably
a long and complicated task, but the result could be an archive
of GREAT Atari stuff! Imagine a cracked version of MULE available
by ftp to be easily used off your hard drive (or SIO2PC) -- LEGALLY!

comments? suggestions? ideas?

If someone could get this to the Author of Sio 2 PC it would be a big help:

I would like to use the SIO 2 PC link for a BBS the big problem is the limitation on disk size. With my clone I have a 200 meg drive. It would be nice if I could create say a 16 meg file (partition?) so that I could keep all of the BBS and related files on the hard disk, then all the server has to do is load the files from within this huuge file. Also, if say for instance, the message bases were acessed with note and point, it could load the whoe base into ram and thus make it faster then loading from hd then passing it to the 8-bit. But the need for a larger partition is a must.

I used to write for both ANALOG and Antic, so perhaps I can shed a little light on the subject. ANALOG's contract gave authors two options: you could either keep the rights to your published programs (and get paid a bit less), or sell them to Analog 400/800 Corp. I sold the rights to all my articles (greedy as I was). Many regulars, David Plotkin for example, kept the rights to their programs and sold them on the side, through mail order, etc. I don't know how to determine who holds the rights to any particular program in Analog. And I don't know what happened to the rights which Analog bought. I can't remember how Antic handled things.

Several ex-ANALOGers, including Andy Eddy and Clayton Walnum, now work for a magazine called Video Game & Computer Entertainment. You could write to them and ask, or at least try to get an address for either Lee Pappas or Michael Deschenes, which nobody has heard from lately.

BTW, has anyone seen or heard from Joel Gluck since 1984? He wrote some stuff for the long dead Atari Program Exchange and wrote an excellent column on writing games for ANALOG ("Our Game"). The column just ended abruptly when ANALOG was still numbering issues in the teens.

>I think I have a copy of Tempest for the 800. I'll see if I can dig it up
>for you...
>
This brings up an interesting issue: Why did Atari, whose coin-op
division wrote Tempest, not market it on any of their home systems?

The two closest things I know of are Axis Assasin (from Electronic
Arts), and Livewire. The latter is public domain. It was published in
Analog magazine, around 1985 I think. I have this program, and the source
code (probably in Mac/65). I can send it to any interested parties, or the
ftp site if there is sufficient interest. There was also a modification
to allow the use of paddle controllers; I'm not sure if my version includes
this or not.
It would be nice to have an Atari archive containing all the old ANALOG
and ANTIC programs.

> is *almost* that, but when I type a key on, say, the atari, it isn't
> processed
> until a key is pressed on the terminal, and vice-versa.
```

Ok. The problem is in lines 50-80, where you check for a key in the keyboard input buffer. You're not checking the keyboard; you're checking the R: output buffer instead. Change these lines to read:

```
50
60
70
80 IF PEEK(764)<255 THEN GOSUB 300 :REM CHECK CH ($2FC) FOR KEY WAITING
```

I'd be inclined to use the E: device instead of K:, opened with mode 12 (read/write), so you could PUT #2,X instead of PRINT CHR$(X). It just makes

things look more consistant. :)

> What I ultimately plan to use this for is something like a *simple* terminal

> connection with an 850 interface, thereby giving me 4 serial ports, one to
> connect to the outside, and the other 3 to connect to 3 of my machines.

Oh-oh. There's a serious problem here. The 850 has 4 serial R: ports, true...
but when using concurrent mode, only one port can be active at a time. Them's
the breaks. You might be able to hack it by using block mode and hardware
handshaking, but not all the 850 ports support RTS/CTS handshake. The code
would be much more tricky, anyways.

> Anyway, I suppose this is the sort of thing I ought to do in a real language
> (Action, I imagine. I haven't used it, nor have I used C on an atari).

You certainly should. You'll find that cartridge BASIC is painfully slow.
Don't even think about 9600 bps; you'll be lucky if you can get 1200 bps on a
single port working ok. Action! would be ok, but assembly is really the best
route.

4644. Percom/memory upgrade questions

Newsgroup: comp.sys.atari.8bit
Date: 1991-10-30 13:49:06 UTC
From: jewison@aurora.physics.utoronto.ca
Message-ID: <1991Oct30.134906.2224@generic.physics.utoronto.ca>
Source record: 113496

Greetings, all.

I have a couple of questions which I hope someone may be able to answer for me. Since I suspect question #2 will generate some response I would suggest that any replies be done via email and I can then summarize to the net. That said...

1) I have had for almost a decade now a Percom DS/DD drive. I recently read somewhere that because these drives are programmable (i.e. the 12-byte config block) you should be able to read enhanced density disks. Is this true? And if so, what values would I need to enter into the config block (number of tracks, sectors/track, bytes/sector, etc.)?

2) I have an 800XL hacker special to which I'd like to add some memory. I don't have a lot of time for any of the homebuilt (eg. Peterson) variety so I'm looking for something commercial. I know CSS sells a 256K upgrade for the 800XL, and I suspect IC does as well. Can anyone point me to any other upgrades out there? One note: it MUST be 130XE compatible, which I believe disqualifies the Newell upgrade.

Muchos thanks in advance.

LIVEWIRE was published in a 1984 Issue of Analog; I thought it was a
pretty decent Tempest variant. The enemies are completely different
though, including one which reflects your shots back at you. The
levels (in sequence) spelled out L-I-V-E W-I-R-E. I think the game,
as published, let you select between joystick and paddle control (the
latter definitely being preferable).

BTW, Livewire was written by Tom Hudson (of Degas fame) who was
supposed to be a big fan of Tempest.

Examination of the startup code in Star Raiders reveals that it initializes
the hardware registers via a straight indexed store to $D200,X (I believe).
In any event, during this initialization, $D201 gets initialized, which is
a bad idea on the 800XL, since this swaps out the Operating System. Changing
the STA $D200,X to STA $D202,X (or even NOP NOP NOP) should fix the problem.

I'm not sure if the addresses are totally accurate, but I do know I got Star
Raiders to work, from disk, with my 800XL.

I'd like to thank all for the thread on this subject. I took the file
home, fixed the bug (sorry, but it was real obvious) and tried it. A
little hacking was necessary to get it to work on my SX212 and the driver
I am using, but with BASIC I ATDTed the modem and had a great session
with my machine here at BBN. OK, so you have to eat the nulls and the
line feeds, but I am ready to do a couple of projects I have wanted to
do: add the ability for EMAX to take input from the line into a buffer,
and to do a VT100 emulator for the XEP80. OK OK there are some that
claim to work, but so far nothing for SX212, and nothing without bugs
(that I know of).

I guess a good thing to have is protocol support for transferring files.
I should get the real docs for the SX212 driver, and for the right
file transfer protocol. Anyone out there who can send me the docs?

Message-ID: <1991Oct31.133231.10013@generic.physics.utoronto.ca>
Source record: 113356

Since I posted my original questions yesterday I have received several queries of the sort "what is IA8 and how can I get it?"

The Info-Atari8 Digest is a mailing list which is to a large extent a mirror of comp.sys.atari.8bit. The beauty of it is, however, that if you have no access to usenet you can still partake of many of the discussions that arise in c.s.a.8bit (although only those people who subscribe to the mailing list will see those messages submitted to the list. I'm not sure that submissions to IA8 get cross-posted to Usenet, whereas all Usenet postings are sent to IA8. Someone correct me if I'm wrong.)

I didn't see Jeff's posting to Digest Vol 91 Issue 82 appear on c.s.a.8bit, so I'm guessing that Jeff has no access to Usenet (right Jeff?). *I* subscribed to the digest earlier this year when our system administrator refused to lengthen the 6 hour expiry time for this newsgroup's messages and I'd end up missing a lot of stuff.

If you want to subscribe to the Info-Atari8 digest, send your request to:

Info-Atari8-Request@NAUCSE.CSE.NAU.EDU

to which I have absolutely NO affiliation.

Looks like my attempt to announce details of the WAACE Fest a week ahead of time got ground up in the failure of someone's disk drive & didn't appear in IA8 until 3 days after that Fest ended. ARRRGGHH! (At least, that's what I heard from JRD.)
So now I'll take a shot at announcing a Fest 3 weeks ahead of time & see what happens:
Chicago Computerfest by Atari
November 23-24, 10AM-5PM both days
Ramada Hotel O'Hare
Rosemont, Illinois (about a mile from O'Hare Airport)
Admission: 6 bucks at the door
Info, write Lake County Atari Computer Enthusiasts [LCACE]
P.O. Box 8788
Waukegan IL 60079-8788
or try Mike Brown on GEnie: M.BROWN56

I think Mike is also on this Net, can't recall his address.
This should allow enough time for the Net to break down & get fixed again in time for this message to go thru (I hope!).

Source record: 113364

A suggestion for all contributors to this newsgroup: maybe try to include your name somewhare in the text of yer msg? I gotta print out my IA8 & then delete it right away, & those long net addresses often get cut off so I can't see who sent it.
Anyway, Nightcrawler, I'm always interested in receiving manuscripts from people. It's a good idea to let me know ahead of time what yer thinking of writing about so's yer don't end up doing something we already did. Contact me at the addresses given below.
I will need to know the following info:
1) Yer real name
2) Yer snailmail (postal)address
3) Any Net addresses I can reach you (Itried to send you INET mail, it got bounced)
4) A phone #, preferably where you can be reached in the evening/home.
So far about 85% of the stuff people send me has made it to print. I can down-load manuscripts from INET or GEnie. Any programs/software, I prefer to receive on disk via snailmail. Even if I reject your piece, I will definirely read it & give you a response. And hey, the pay is fabulous: *not one red cent!* Yup, us guys all work for free, it cuts down having to pay extra income tax, yer kno. But jutah make yer feel better, we give yah a freebie copy of the mag with yer article in it so yah can show all yer friends. Nice, huh?

Oh, yeah, theres a 60% probability I'll make it to Chicago.

Why not Donwload the 1050 Drive Diag Program from Compu-Serve and run
the track zero allingment test? I havn't looked at the service book recently
but I thought you could do this thing manually w/o the scope if you just remove
d the Track Zero sensor. Try it. MOve it around until it says its ok.

let me know if I'm totally of base here gang.

Do a Hex search for 9D 00 D3 and replace it with EA EA EA!
I thanks the person who pointed this obvious address conflict out to me!
The address is though $D300,X not $D200,X. This makes it work on
the XL'x and XE's....but why did it already work in a 1200XL which has
the same address and does the same thing as in the 800XL?

One more quick quesion: What is the difference between the
1200 REV A roms and the 1200XL REV B roms?

I doubt it unless the Microline uses plug-n-print modules like the Okimate 10.
And if it does, they would probably be harder to find than a used 850 or P:R:
interface.

Have you seen VT850? It does VT100 quite well on the XEP80, and I
use it with my SX212. It doesn't do file xfer, though.

>
> Info-Atari8-Request@NAUCSE.CSE.NAU.EDU
>
>to which I have absolutely NO affiliation.
>
>
>- Mike Jewison

I have no affiliation with it either, but let me add a couple things, to
hopefully clarify the situation.

The Info-Atari8 Digest is simply the messages from the Usenet newsgroup
comp.sys.atari.8bit, grouped together and e-mailed out to those who have
subscribed at the above address. ANY posting that appears on
comp.sys.atari.8bit will appear in the Digest.

With most mailing-lists like this, a message sent to the Digest address will
automatically be posted to the associated newsgroup. This IS NOT THE CASE for
the Info-Atari8 Digest. Anything sent to info-atari8@naucse.cse.nau.edu
WILL NOT be seen on Usenet, even though it will appear in the Digest.

Thus all the confusion.

The solution is simple. DON'T post to the Digest; DO post to

comp-sys-atari-8bit@ucbvax.berkeley.edu

This will seem funcionally identical to Digest subscribers, but readers of comp.sys.atari.8bit will see your postings for the first time.

I believe there are a great many more comp.sys.atari.8bit readers than Digest subscribers, so this will increase your audience greatly.

I do hope this helps clear things up.

OK, guys, I can take a hint. Sheesh. What follows is the same list I gave to the LCACE guys for the Chicago Fest. I compiled it this past summer, since then I've run across another dozen or so I just haven't time to gather the details about. I'll probably be uploading the list to the 8bit library on GEnie, too.
BTW, if someone wants to pass this on to the Atari Archive on the Net, that would be nice. I don't time, & uuencoding stuff bums me out.
Be cool, my next transmission will be the list (56 entries!).

Michael,

I would love to see EMAX. I have an XEP80 and have been dying to see a editor for it. I have Turboword 80+ from Micromiser Software and it is slow because it runs under BASIC and it has lots of support files so it gobbles disk space. How can I get EMAX?

Sincerely,
Jeff McWilliams

I'm fairly sure that the Percom drives cannot read enhanced density disks.
Enhanced density (127K) was released in the 1050 disk drive years after
Percom
released true double density (180K) disk drives. The 1050 does not configure
the way a Percom drive does - it has it's very own format which no other
drive
mfr. used - what else would you expect from Atari. The XF551 does read/write
single (90K), enhanced (127K) and double density (180K) disks, both single
and
double sided.

>who doesn't have their own obnoxious signature yet

Well yes there is, but there are not too many that have alot of game modules or any modules. I wrote my own bbs many years ago on a 320k Xe running Basic xe. This system was awsome, and for many years was one of the most popular systems in my area. Most of my users were not atari kin either.

THe system was a game, within a game, within a bbs, within a bbs!

When you logged in, you had an option to Play? or not, if you said no, you were sent to the citidel type message system. It was a copy of citidel for sure. Including hidden rooms, and the ability for the users to make there own rooms.

The rest of the system was an on going adventure, where all the users matched wits against the others. Competing for power. There we fun things like a cash system, everyone had to have money to survive. To earn money you could find a job at the employment office, or you could go to the casino and play craps and other vegas type things. You could try to rob the system bank, but if you got caught by the CPU Gaurds you would get put in jail. The jail was a room in the message system, and once you were jailed all you could do was sit in that room till your sentence (from 1 to 4 days) ran out, or someone bailed you out. You could post messages, and if you knew the system well enough, or heard a rumor about the tunnel, you may be able to escape, but then you would be wanted for escaping from prison! And that was a heavy fine, in the millions, but, you had to be cught by the system police.

You could send letter bombs to other users, it would say "YOU HAVE MAIL" as it did most the time anyway. When they opened the letter, it would explode taking points, cash and anything they had on person, then log them out. Unless they had a flak vest, which could be bought at the supply depot.

You could hire a Terminator to track, and zap a user. Once sent, a terminator always follows his victim, sometimes for days, then, bang, he appears and ZAP!

Unless of course you paid the fee at login for a body gaurd for this call.
In that case, the body gaurd would disable the terminator, and rread you the
number on the id plate, which of course is the number of the user that sent
it. Does this mean war?

I could go on and on, but I will not take up anymore net time. I wrote this
all myself, I really never finished all of it. Its a system that could expand
forever. I have it around somewhere, but its really not for sale. BUT! to see
it up and running, I might lease it to you for a small fee, and help you get
it going. After all, I spent over 3 years designing and writting this thing.
It might as well get some use!

Regards
Randy

I'm looking for a book that I saw some time ago, by the guy from OSS,
uh... Bill Wilkinson (I think)-- it was published by Compute Books,
called "Inside Atari OS" or possibly "Inside Atari DOS". In any case,
if anyone has a copy that they would like to sell me, or knows where
I can get one, I'd like to know.
Thanks.

Jake

Source record: 113401

I copied all my 8 and 16K carts to disk for convenience. I had an Atari 800
and I had modified the center memory board (the one that conveniently maps to
the same place as cartridges) to make it possible to disable the write enable
line with a switch. (The colored plastic cover to this switch being jammed
into the cartridge door interlock) All I had to do is load the image file
into memory from DOS, flip the switch, and hit System Reset.

This didn't work with the OSS Basic XL and Action! carts, but with the ability
to put DOS into memory "under" the cartridge, I didn't have a need to.

Ah, the misspent days of my youth. Now I work on Sun4's.

Cheers!

4688. VT PROGRAMS

Newsgroup: comp.sys.atari.8bit
Date: 1991-11-03 03:24:19 UTC
From: JJMCWILL@MTUS5.CTS.MTU.EDU
Message-ID: <9111030341.AA28492@nettlerash.berkeley.edu>
Source record: 113391

I think it was Stan that was thinking of writing a VT100 program. I have
been looking for one good dependable program to fulfill all my communications
needs and to date I haven't found one. This is what I am looking in a
term program, and it seems to be a pretty reasonable set of expectations.

VT102 emulation
PROFS keypad configuration for IBM mainframe systems which is what I use
80 columns
ASCII mode
Kermit
Xmodem, maybe even YMODEM or Ymodem batch
Sends a break signal
2400 baud

Many programs support some or most of these, but none support all. Omnicom
has come the closest but is missing simple ASCII terminal (darn!) Kermit65
didn't support profs keypad or xmodem. VT850 doesn't support profs keypad
or file transfer and with the standard XEP80.sys it had terrible problems
keeping up with the incoming text, especially cursor control commands even
at 1200 baud. VT10sq can't do a break or go beyond 1200baud or do file
transfer. Bobterm can't do full vt100 or profs keypad or send the break
signal

SOMEbody on here mentioned a program called Zterm .85 or something.
Can you tell me more about this program? Adding Zmodem would be a great
addition. I am more than willing to have a program that requires the use
of 130XE type memory as well.

Source record: 113394

The Atari lightlab plugged into the joystick port and has RCA type connectors
for Voltage, Ground, the Two paddle inputs, and the Digital inputs/outputs
of the corresponding bits or PortA of the PIA chip. It comes with a manual,
a thermistor (electronic temperature sensor), and a cartridge that will
read the thermistors values, calibrate it, record the data on cassette or
disk, and even graph the data over a time domain. The manual is excellent
for Gradeschool science and maybe even some high school science classes.
The light module comes with a light and light sensor. It also has polarizing
filters and some other stuff, including a test tube I think for shining light
through chemicals. This tells you something about the properties of the
solution but I am not sure what. It also has a cartridge and lab manual.
It will show as a percentage how much light is reaching the sensor. It is
quite sensitive. The lab manuals have all sorts of experiments and stuff
you can do with the different sensors. I think the light module will let
you record light and temperature data simultaneously. There are some great
ideas for science projects in the lab manuals.. I think two temp. sensors
or two light sensors could be hooked in at once. The manuals give you the
program code needed to make your own BASIC programs to read the different
sensors. When I brought the lab kits home from the show my uncle was
very interested in the temp sensor because he works for a factory which
among other things plates parts for GM. They use temp. sensors alot
to monitor the plating baths and stuff. Thermistors could be bought but would
have to be calibrated and I don't know if what would need to be done to treat
them so they can be dipped in solutions. The Atari temp. sensor is coated
so as to be nonconductive to electricity.
I hope this helps!

Message-ID: <1991Nov3.144628.12483@magnus.acs.ohio-state.edu>
Source record: 113396

As I understand it, the <BREAK> signal is sent via an XIO to the "R:"
device driver.
It should be possible to write a generic machine language program, say,
assembled in the cassette buffer, to send break from ANY terminal program.
On XL/XE machines, the <BREAK> key has an interrupt vector assigned to it.
This vector is not used by any major programs I know of. So, the procedure
to add break would be 1) Remove any code which disables the <BREAK> key
from the terminal program in question (should be easy with a sector editor)
16 and its hardware registers are the numbers to look for (i.e., STA 16).
Replace with NOP's. 2) Determine which IOCB the terminal program opens to
"R:", so you know which one to use your XIO on 3) Write a short ml
subroutine, which you will append the ml term program to. It will reside
in some unused area of memory and be activated when <BREAK> is pressed.
The subroutine will simply execute the appropriate XIO command via a CIO
call.

4697. Atari termcap?

Newsgroup: comp.sys.atari.8bit
Date: 1991-11-04 01:39:46 UTC
From: spam@IASTATE.EDU
Message-ID: <1991Nov3.193946@IASTATE.EDU>
Source record: 113398

I've been seeing a lot of talk about making the atari emulate all
sorts of terminals. But UNIX users have another another option;
to make UNIX talk properly to the atari. Has anyone looked into
writing a termcap for the Atari that will use atari's native screen
controls, so that emulation wasn't necessary?

From what I understand about termcap it ought to work fairly well, and
it should be pretty easy, too. Of course, it helps to own your own
UNIX box and to be sysadmin on another.

Actually, I'm only just learing about termcap, so I may be completely
confused. If so, gentle flaming only, please! Anyway, if anyone out
there wants me to look into this, please respond...

Note that this is only beneficial to users of unixoid OS's (but what
else is there, really?)

thanks.

Cross-posted to:
misc.forsale,misc.forsale.computers,comp.sys.tandy,comp.sys.atari.st,comp.sys.atari.8bit,comp.sys.ibm.pc.hardware

Would it be possible to network a few PCs and Macs by connecting their TX/Data and Rx/Data lines together and simply sending some simple header information before each transmission? Would this essentially be any different from any single-channel network? Would it simply be a problem of impedance matching? In that case, I suppose that about 3 PCs should work with no special matching circuits. Is this what the $25 network is? How about a simple TSR which would allow transparent file operations using the serial port, or, perhaps, remote logins--OS/2 should allow this already, I suppose!

Thanks.

Fellow netters and ATARI enthusiasts: I need your help!

I run a non-profit charity that donates computers to institutions, groups, and families that cannot afford a computer. In turn, I provide the person(s) donating the machines and software a receipt listing the equipment and its fair market value so they can take a tax deduction.

Early this summer, two ATARI machines were donated. I have had no luck thus far finding out what a fair value for these two machines (and all their peripherals and software) would be.

I have an institution that works with the handicapped that can use the equipment and software listed below; however, I do not want to donate the material until I can determine its fair market value; not only for the person who donated it, but also for the recipients (institutions have to list fair market value for any donations THEY receive, too! Darned red tape...)

The best I've been able to determine thus far for *ALL* of the equipment and software listed below seems to be far too low ($75??? With the printer and modem too?).

The kind gentleman that donated the following has been waiting 5 months for the receipt - and the institution is looking forward to the game machines! Please help me by providing what you believe is fair market value for the following equipment and software.

Thanks in advance .... Terry Davidson

I recntly (a matter of mere days) posted a list of Atari (mostly ST) BBSes from around the world...since then I've been flooded with lists of Atari (alot of 8bit ... alot of ST) BBSes from within my own *state* (Ohio) that I never knew about. This leads me to believe that there are hundreds of other BBSes I've missed. So if you know of *any* Atari BBS that is still in operation, please send me the following info...and I'll post the updated list in a few more weeks.

Need: BBS name, number, baud rate, storage capacity, software it uses, and also the city/state/country it's located in. (Oh, and whether it is 8bit or ST or both)....oh...and if it's parttime or fulltime.

I started on it once, but didn't have much luck. I think termcap
strips off the high bit, messing up things like delete. Also, there is
the problem of the newline character input, which can't really be fixed as
far as I know.

I know I'm going to regret this just due to sheer volume of response, but... I've bought a number of used Atari 8-bit systems in the past and have amassed an impressive collection of Atari games, both commercial and -- let's face it -- "pirate." If and when anybody determines the legal status of any particular program, I would be willing to post the occasional goodie -- my reservation centers at present around an interesting point: if a company either declares an Atari 8-bit program outright PD, or simply says "do what you must, does it make any difference to, say, my posting something, that I'm coming off a disk that was ALREADY a pirate copy? It's kind of a "second level" in the issue, if you know what I mean. (Or am I just babbling again?)

Message got out fine. I don't think Mike is on the net, although he is on
several BBS's in the Chicago area. Several of us Atari 'nuts' from Chicago
are on the net though and we are looking forward to the Chicago Atarifest.
Hope you can make it Ben.

Although this isn't really what was asked for, I use the following
termcap entry with AMODEM in ASCII mode. It works with emacs, but
it's kind of painful because there is no direct cursor addressing.
This termcap entry is deliberately formatted for a 40-column screen.

```
atari|Atari 800XL:\

4706. ALCHEMIST WITHDRAWS FROM CURRENT NOTES

Newsgroup: comp.sys.atari.8bit
Date: 1991-11-05 17:15:52 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9111051715.AA08380@smithkline.com>
Source record: 113310

Well folks, all good things must come to an end.

On Sunday, Nov. 3, my house caught fire. On Monday, Nov. 4, I called Current Notes & told Joyce Waters I would be unable to continue as 8-bit Editor of that magazine. Insofar as a number of articles for the Dec. issue are well along- essentially complete- I'll hang on awhile longer & see to it the Dec. issue 8-bit material gets edited & submitted. After that, the lights go out. I will still maintain a presence on GEnie & INTERNET.
I have no idea when, or if, The Alchemist will return to CN. If anyone wishes to take over the job, contact Joe Waters at (703)450-4761. The job requires long hours & pays nothing. However, I shall be glad to provide whatever assistnce I can to get the new Editor started. Requirements for the job are that you must have polished writing skills, good grammar & spelling, & be knowledgeable of the Atari 8bit computers. It also helps if you know people in the developer/vendor/usergroup community &/or have spent time in an asylum.

As for me personally, if the fire which smoldered in the wall had continued to smolder for another 30 minutes before taking flame, I would not today be alive to send this message. I would by then have been asleep & would most likely have perished in the blaze. Damage to my home is estimated in the range of $25-30,000. The cause of the fire was defective masonry in the chimney just above the fireplace in my den, along with some gross violations of fire safety biulding codes, well-concealed behind thick (expensive) solid pine paneling. The thing was built by a slob & inspected by a crook/drunkard. In other words, a pristine example of MADE IN THE U.S.A. Every time I built a fire in that fireplace, I was rolling the dice. On Nov. 3, my Number came up.

Just like the O-rings in the Space Shuttle SRB's.

I have 3 smoke detectors, all with fresh batteries, none were activated. The fire in the wall broke thru on the outside of the house. The fire in the fireplace was almost out, but slight wisps were coming out from behind the paneling in my den accompanied by hydrochloric acid fumes from the vinyl siding on the outside which was already aflame. I was upstairs using my 800XL to read my GEnie mail just before going to bed. I couldn't see anything but called the fire dept because of the odor. While I waited for the fire dept to arrive I decided to check outside. I saw the flames & almost shit myself. I went to work with a garden hose & prayed please God don't let my house burn down. The firemen later said my quick action saved the house, though at the moment I'm more inclined to believe it was my prayes that did the trick. Plus the fact that my employer requires all us research chemists to attend annual fire training/safety classes. I didn't even ralize I was aiming the water at the base of the fire just like they taught me in the class. But believe me, I was praying the whole damn time. Before the firemen arrived I needed all the Help I could get.

Thirty men with axes went to work on the wall inside & out, flooded my den with water & pretty well trashed the joint. But my house was saved, tho at the moment it smells like hell. That whole side of my house will have to rebuilt. I got to bed at 4AM that night, my 800XL was still on, I never finished reading my E-mail.
Either I was damn lucky, or Someone answered my prayers. I'm still around & the essential areas of my house are intact. I'm still a bit sore from my exertions that night & have spent most of my time cleaning up the mess in my driveway. Dealing with the fire inspectors, insurance, adjustors, contractor s, plus the vermin lawyers who come out of the woodwork at these times, will occupy my full attention for the next year. Computers are now pretty low on my list of priorities.

As they say, shit happens.

Hello,

Does anyone know where I can get one of these MircoPort Experimenter boards?

Supra made it for the XL parallel expansion bus. They came out with it back in '86 I believe, at least I hope they released it! I also remember that it was to come with a PIA, power supply, proto board, and instructions for building stuff.

I will contract Supra, but I thought I should ask here also. Either email to me or post here is fine.

Any info is appreciated.

Thanks,

Bill Hutchison

Ben,

Am stunned and saddened by the series of events leading up to and including your withdrawal from CN. I personally was just discovering your column in CN and finding it to be an invaluable source of information. Hopefully people will pick up the torch and make an effort to fill the emptiness in CN that your departure will leave. I for one will make an effort to contribute, small as my contribution may be.

Regarding the Parallel Bus Experimenter's Board, it is available for $12.00
from Best Electronics. For that price, all you get is the board and the PBI
connector. You have to purchase the rest of the components separately,
which is power supply and AC to DC circuitry, the PIA, a quad dip switch,
and an address decoder chip and a few other misc. parts. Best has all these
too they just don't sell them with the Experimenter's Board Package.
If you ask them though, they might just give you everything you need in your
original order.

Has anyone actually tried to build the NASTY connection ?

I am just wondering, cause if so you might be interested in
the following:

NASM65 -- assembler one-pass, closely MAC/65 compatible
NLINK65 -- linker, produces run-time relocatable code
NLIB65 -- librarian
DISASM65 -- disassembler
DEMAC65 -- MAC/65 detokenizer
CRLF155 -- file converter
and more..

Cross-developement tools, for TOS, UNIX (and MSDOS).

THIS STUFF IS USELESS IF YOU JUST OWN AN ATARI 8-BIT AND NOTHING ELSE.
IT'S MOST PROBABLY USELESS IF YOU DON'T HAVE A NASTY CONNECTION.

If noone cares about this stuff, I needn't bother atari.archive with
approximately 300K of archived uselessness.

Nat!

I have a handful of questions. First, I have a 1050 w/ US Doubler, but no SpartaDOS. The manual claims a dramatic speed improvement using SpartaDOS. How true is this and is there any utility that will give me the speed increase without shelling out bucks for SpartaDOS? Right now I'm using an ancient version of MYDOS I had hanging around. (As well as DOS 2.0/2.5 and Happy-DOS from the German magazine Happy-Computer that also brought us Turbo Basic XL...) Anyway, any technical insight here would be welcome. The US Doubler manual basically said buy SpartaDOS. Second, I've tried using the IBM to/from Atari disk utilities that came up here a while back. Yes, I got them working on the IBM. No, they have never successfully transferred a file from the IBM to an Atari disk. Has anyone managed this? I really have no other way to get stuff from the net to my 800xl for now. Third, I have a copy of Interlisp/65 for the Atari I bought a while back when Antic was closing out their catalog. It has never worked very well at all. In fact, it will not run many of the example programs on the disk, and many of the short examples used to demonstrate commands in the manual will not work. Does anyone have experience with this product? Finally, sometime this winter I would like to bring my XL up to 256k. I know there's a disk image on terminator describing the upgrade, but I really need an ASCII file until I can get a reliable means of transferring stuff to the XL. If anyone can help out on any of these, I'd sure appreciate it.

James Hague lamented never finishing Necromancer, possibly the best game ever for the Atari 8-bit line. He did not miss anything in the gameplay as far as I can tell, except maybe that after the grown trees crush the spider eggs you can hit them with your wisp and re-use them.

But yes, I _did_ finish it, on three (four?) occasions. I'm a twitch-game fanatic and this is one of the hardest games to complete that is not impossible. When you hit the last tombstone everything freezes, the screen blows into many scintillating bands of color, and a patented Atari Phase Drone rumbles and then dies out into silence as the colors dim. Back to title screen. Not a great ending, but knowing you finished the game is its own reward, and it is pretty cool.

Second hardest game to finish: Air Strike. I got through level 1 twice but didn't play it as much as Necromancer 'cause it wasn't as good. Had to remove shoes and hit spacebar with foot, also. // g

There really is. I would say the 3X improvement claim is accurate. Not exactly to the point, but (independent of the US Doubler) SpartaDOS file format also uses a variable directory size, so you don't get charged for space for 64 files every time you create a subdirectory. Also, the disk format does mapped sectors rather than linked sectors, so operations like deleting large files, and point, get additional speedup. If you can get SpartaDOS for say $20, it would be worth it. Note that there are two products: disk-based SpartaDOS, and the cartridge-based SpartaDOS X. 'X is probably more expensive. Unfortunately, some of the utilities I use won't run under it, so I too use MyDOS.

>Is there any utility that will
>give me the speed increase without shelling out bucks for SpartaDOS?

No, unfortunately, that I know of, anyway. A thought just occurred to me - now that ICD has dropped the line, do you suppose we ought to do a write-in campaign to encourage them into releasing it to PD? And the sources?

>the IBM. No, they have never successfully transferred a file from the
>IBM to an Atari disk. Has anyone managed this?

I have been using "util" for a few years. I have the following hints:

1 Do not attempt to format a disk on the PC. Do it on the Atari.
2 I have never been able to use over say 50K bytes of a disk.
3 Binary files can be a real problem. UUencode them first.

I can't help with the other questions. -Stan

This is probably well worth a try... If I remember correctly, ICD also carried the whole OSS line of fantastic stuff like ACTION! and MAC/65, so if they were VERY generous, the remaining 8-bit community would have a lot to gain. Given the extreme remoteness of any possibility of an 8-bit renaissance because of the very powerful and sophisticated computers available now in the traditional $1500-$2500 range, this would be a real boon to the remaining hobbyists like myself that still like to fool around on their 8-bits. Best probably to ask for PD SpartaDOS and sources, and suggest the idea of releasing their whole line.

1) Yes, I did this. 2) Sounds familiar. 3) Yeah, I get empty sectors written seemingly randomly through my files. Unfortunately, I don't have UUencode utilities for the 8bit- I can probably get them via FTP but again, I can't get them into Atari readable form.

Hmm... I use UTIL all the time...well for atleast transfering files from
the ibm to atari disks. It has been my experience to format the disks
on the IBM drive...this is because..(the author of the program tells me) that
the IBM controllers are very tricky if not really stupid pieces of equipment
they have a rather tough time handling stuff formated on another drive
other than its own. secondly, Util was designed for use on double sided
(I think) atari drives. It is actually writing VOTC tables for 1440 sectors!
You will notice this if you try to fill the disk up...the head seems to bang
forever against the stops. Secondly..GET ATARIO...a different program but
sometimes UTIL comes under the same file name. ATARIO has a nice read
title page...lets you set the type of atari disk you are reading from and
does some other nice stuff like sector thingys....=0 It only
reads atari disks though...if you want I can type up a file on how
to use these programs with the least amount of system crashes.
For now...I must go.

Yes ICD did buy out OSS products. From what understand Dataque is
trying to buy the rights to at least some of the ICD products now that
they are dumping the 8 bit stuff.
It would be great if we could FINALLY get technical documentation on
the internals of SpartaDOS-X! Then we could all figure out how to
write DEVICE drivers for the silly thing for things like the
OMNIVIEW 256 80 column chip and an internal no-slot clock project I
was kinda working on at one time.

I used to do much hacking on my Atari 400 and 800XL. I learned assembler
and a good deal of Atari internals. I made it a point to try to figure
out how every game worked, often so that I could change the game to "cheat"
and see the ending.

The game Encounter, by Synapse, still has me baffled though. How the heck
did they implement those graphics, and get it to work so FAST? Anyone have
any ideas? For those who aren't familiar with Encounter, it was a 3-d
game where your ship was roving around on a landscape with various obstacles
and enemies hunting you down. Admittedly, the shapes were simple filled-in
planar objects, but still the speed was impressive.

SpartaDos does speed disk I/O up 3 times, when loading files, etc., but you MUST transfer all the files from your DOS 2.0/2.5 disks to SpartaDos disks to see this speed increase. Unless you have at least two floppy disk drives, or if you have only a few disks to use, I wouldn't recommend it. SpartaDos has a different file structure, which also speeds things up even more SpartaDos disks are laid out in a fashion similar to MS-DOS. When you save a file with the same filename over itself, SpartaDos only needs to read the FAT map to find out what sectors on that file, and writes over those sectors. Compare this to the way DOS 2.0/2.5 works - they have to read the entire file noting the sectors used, then write over these sectors. Obviously, the DOS 2.0 method is nearly twice as slow as the SpartaDos method. Personally, I use both SpartaDos and MyDos.

4733. XEP80 under SpartaDOS X

Newsgroup: comp.sys.atari.8bit
Date: 1991-11-10 05:51:23 UTC

Message-ID: <1991Nov10.055123.20215@usenet.ins.cwru.edu>
Source record: 113337

Can Atari's official XEP80 handler be made to run under SpartaDOS X? SDX includes its own xep80.sys handler, but this handler turns out not to support many of the XEP80's features, including the printer port. This makes a generous portion of XEP80 software unusable under SDX.

Has anyone made the combination work?

Norman, I think they used magic to get the graphics that fast.
Honestly - they probably rewrote the operating system to ignore things like the keyboard (which has a certain amount of overhead) and{there are some damn good hackers out there. On the ST, hackers in Europe actually hooked an oscilloscope to the video, MMU and CPU chips to check the waveforms, and then they figured out how to do amazing things with graphics, like put 512 colors on the screen at once and eliminate the overscan (border) around the screen - all done with software!

I think they used ANTIC mode 4 to get the graphics so fast, and redefined the character set on the fly. (Only certain characters would need to be redefined this way.) Also, extensive use of PM graphics with the "width" bits set to maximum helps since all the rectangular objects can be represented with players.

This brings up an interesting point; one can eliminate the border on the 8-bit also. I have been able to achieve 29 lines of graphics zero text (all readable) versus the normal 24 lines. The extra five lines are useful for a BBS; one can have the caller information onscreen as well as still having the standard 24 lines of text underneath it. Is it possible to have even more lines on the screen than this? SpartaDOS uses this technique for its TDLINE command, which effectively adds one line to the display list. Finally, it would be very nice to have a modified screen editor which allowed these extra lines to be used when editing BASIC programs, etc. It would seem the best way to do this would be to copy the OS into RAM and modify the part that creates the Graphics 0 display list, as well as the scrolling routines.

You could maybe get more lines on your screen by hacking your monitor
(or use a PAL 8bit w/ a PAL monitor) but it would be a real trick.
You can get more columns also by changing the size of the playfield
to wide screen. (The address for this is DMA something or another, either
at 749 or 759, I trust you have Mapping the Atari or equiv.) This gives
you more columns than any TV or monitor I have ever seen can display.
By combining these two techniques you can get a full screen scrolling
display (just like Nintendo, well, sort of). I imagine there COULD
be a way to up the clock of the display chips to get all 52(?) columns
on screen, but somehow I doubt it's too likely. While we're babbling
and imagining, the really neat trick would be to hack some fast logic
around the display circuitry that forced it to switch display lists for
each half of an interlaced composite display... THAT would be something.
Incidentally, is Tom Hudson's ST picture viewer lurking on an archive
anywhere (the one that switches GR.8 screens to simulate an ST display)?
I've seen other stuff from Analog, so I'm guessing copyright laws aren't
a problem (???).

Actually, it was written by Matt Ratcliff (sp?). It requires at least 128k. I've got it on an Analog disk, if it is ok to post it, I can along with some ST pictures for it. (Don't get too excited, its a neat hack, but it flickers a lot.)

I have both Apacview and Colorview and they do a really good job, but kinds 'a reminds me of interlaced VGA. Well I guess it's pretty much the same thing on color view, since it is actually displaying three different graphics pictures alternately really fast right? I had downloaded some 400K GIF pictures from the Astronomy RT on GEnie and converted a few to RGB (COLORVIEW's format) and it took a Loooong time. I also have a bunch of straight RGB pictures from GEnie. If anyone is intersted, I could FTP them to Atari.archive...

Maybe one or two more, but you're reaching the limit. If the display becomes too long, the last bit of it will inhibit the generation of a proper VBLANK period. You can tell this has happened when you can't get the monitor to sync up any more; the screen refuses to stop rolling.

> Finally, it would be very nice to have a modified screen editor which allowed
> these extra lines to be used when editing BASIC programs, etc. It would seem
> the best way to do this would be to copy the OS into RAM and modify the part
> that creates the Graphics 0 display list, as well as the scrolling routines.

You'll probably find compatibility problems with some software. It's suprising how many places the constant 24 can show up. :) A full-screen application like an editor or terminal program might be more practical, because the application has full control of the screen. No OS changes would be needed, since you're handling the screen directly.

While you're at it, there's no reason to stop at making the screen longer. You can increase the width to 48 characters by invoking the wide playfield mode, too. Using a 30-line screen equivalent in ANTIC mode F, that gives you up to 384x240 resolution. Don't try this with a TV set. :)

The main thing that made it easy is that every object looks the same
from every angle; the ships and the pylons and the shots. Thus, to
create the screen all you have to do is specify a X,Y position and calculate
the distance from you. I'm sure there is a table for each object, and init is
a list of the objects parameters for each given size. Thus, you determine
the X,Y of the object, then point to the right size in its lookup table,
then draw it. The only reason games like Battlezone and Hard Drivin need
so much processor power is that each object has thousands of appearances
based on your position relative to them; Encounter only has 10 or so
per object.

But they did a great job of making it seem really difficult to do!

4749. UUdecode, F1-F4 function keys, stereo sound for the 8-bits

Newsgroup: comp.sys.atari.8bit
Date: 1991-11-14 22:56:07 UTC
From: rlcollins@miavx1.acs.muohio.edu
Message-ID: <7802.2922b8b8@miavx1.acs.muohio.edu>
Source record: 113354

Two questions:

1. I obtained YAU.ARC off of Atari.archive. Reading through the doc file reveals that it won't work under SpartaDos. Is there a uude/encode that will work under SpartaDos 3.2?

2. I would like to add the function keys to my 800XL. (the F1-F4 found on the 1200xl) I've seen Innovatice Concepts kit, but I would like to do it my self. Does anyone have any ideas to point me in the right direction?

One other thing I was thinking about. For the ST you can get the Tweety board that will take the three voices and split them so you can have stereo. (One voice goes left, one goes right, and the other goes both.) Now what would it take to make an 8-bit version of the? With four voices, two could go right, and the other two left. What do you think?

>Speaking of display lists, have you seen Jeff Potter's APACVIEW and
>COLORVIEW? These two programs are THE way to display GIF pictures
>on an 8-bit.
>From: bmarcum@world.std.com (Bill Marcum)

Are they PD Bill? If so how about UUENCODING them and posting them into
this forum?
In fact any sort of PD 8-bit programme would be most welcome 'down under'
as I don't have access to the 8-bit archive. I've managed to pick up
ATARIO21 in here and also had SIO2PC sent to me via e-mail. Also if
there is a UUENCODE & UUDECODE file for the 8-bit I would be very pleased
to receive them also, at the moment I'm having to do the UUDECODing
on my husband's PC contemptible! Anything, anything at all would be
gratefully received and passed on to the many other 8-bit users around
NZ.

4753. Re: pin outs joystick/serial

Newsgroup: comp.sys.atari.8bit
Date: 1991-11-15 16:22:22 UTC
From: Amos.Jackson@tdkt.kksys.com
Message-ID: <690241709.0@tdkt.kksys>
Source record: 113257

Here's the one's for the joystick:

Taking into account that if your looking straight at the ports:

Pin #1 of the joystick pori is top-left.

1. Joystick Forward input
2. Joystick Back input
3. Joystick Left input
4. Joystick Right input
5. B Potentiometer Input

That was the top row.

6. Trigger input
7. +5V
8. Ground
9. Potentiometer input

That was the bottom row.

The SIO Port goes Bottom top, bottom top...

1. (bottom) Clock Input
2. (top) Clock output
3. (bottom) Data input
4. (top) Ground
5. (bottom) Data output
6. (top) Ground
7. (bottom) Command
8. (top) Motor Control
9. (bottom) Proceed
10. (top) +5v/Ready
11. (bottom) Audio input
12. (top) +12V
13. (bottom) Interrupt

I guess I could have stated it as the top row of pins is even, the bottom is odd and that pin #1 is at the bottom left. Hope this helps you.

While I was typing my last message

the mailman came to the door with

a order I had placed with K Products

In opening the envelope, I found

that it contained a wopping 13

disks of software!! It got everything

from allowing me to call ou to other

(that should be out) boards WITHOUT

having to take the bbs offline, to

"killing" the 128 meg limit on the

MIO, and going beyond that if necessary

(OH BOY)!!! Since today is Friday,

I will use the weekend to upgrade

the system, but will be back online

before the weekend is over.

Amos Jackson

>
> 1. I obtained YAU.ARC off of Atari.archive. Reading through the doc
>file reveals that it won't work under SpartaDos. Is there a uude/encode
>that will work under SpartaDos 3.2?
>
try uudecode.bas, it works, even under SD-X and BASIC XL.

> 2. I would like to add the function keys to my 800XL. (the F1-F4
>found on the 1200xl) I've seen Innovatice Concepts kit, but I would like
>to do it my self. Does anyone have any ideas to point me in the right
>direction?

I have docs, email me to remind me to dig them up and I will email them
to you unless there are other people interested, then I will post the
upgrade here.

>
> One other thing I was thinking about. For the ST you can get the
>Tweety board that will take the three voices and split them so you can
>have stereo. (One voice goes left, one goes right, and the other goes
>both.) Now what would it take to make an 8-bit version of the? With four
>voices, two could go right, and the other two left. What do you think?
>
Definitely, the POKEY controls the sound output, and so Chuck Steinman
has designed what he calls the GUMBY upgrade, fitting isn't it?
It is a second POKEY, so you have a total of 8 voices, 4 left, and 4
right, or 2 16 bit left and 2 16 bit right voices. I don't have the
upgrade installed, but I have the docs on disk here for that as well.
I think I also have a modified music program that will work with the
GUMBY, but so far no one has written any programs or such to
specifically take advantage of it. You interested?

Here is a list of 100 Atari BBSes around the world that are known to still be active. If you notice a misspelling in one of the entries, or an incorrect area code or phone number then please tell me about it. Likewise if you know of a BBS that's not in this list then tell me all the pertinent info and I'll include it on the next list.

Unless otherwise stated, each entry should be assumed to be an Atari ST BBS located in the United States that is online 24 hours a day 7 days a week.

4761. APACVIEW and COLRVIEW

Newsgroup: comp.sys.atari.8bit
Date: 1991-11-17 22:58:34 UTC
From: belor@ruby.ils.unc.edu
Message-ID: <1991Nov17.225834.29404@samba.oit.unc.edu>
Source record: 113262

bbush@cco.caltech.edu asks:
|>Speaking of display lists, have you seen Jeff Potter's APACVIEW and
COLORVIEW?
|>These two programs are THE way to display GIF pictures on an 8-bit.
|
|No... How can I get a copy of them?
|
|Brent Buescher

Jeffrey Potter doesn't have an Internet address per se, but he does have a CIS address, so he can be reached through that gateway. His address is 74030.2020@compuserve.com. I'd be tempted to ask him to UUencode his archive with YAU and Email it to you in chunks. It's shareware.

BTW, as good as APACview is for viewing GIFs by itself, its finest hour is in conjunction with COLRview, a separate utility. APAC has an option to make three RGB separations from the GIF (in GR. 8 or 9 mode, depending on your choice), then save them to disk (have a blank ready). COLRview will load all three, and using a cycled display list, display an image on your screen with more colors than normally possible. I have noticed some flicker on Quasar TVs, but other users say their TVs don't do this. Imagine the shades of GR.9 (or the resolution of GR. 8) combined with the colors of GR. 11, and you'll get the picture.

It's truly stupendous, and he only wants about $20 each for each utility.

APAC's only drawback is the limited zoom capacity; also, there's a bug which makes it zoom with uneven proportions on some GIFs.

Why aren't *I* posting it? I sold my Atari six months ago (put those rotten tomatoes down, I needed the cash).

Speaking of putting things in the Public Domain, David Young has advised me that he is willing now to have OMNIVIEW and OmniWriter source code placed in the Public Domain. He released the source to me some time ago so it's just a matter of finding the time to upload it or whatever.

Meanwhile I have devised a short list of OmniWriter enhancements which would be very useful. Is there anybody out there who is interested in adding such enhancements and maintaining an "official" PD version of OmniWriter? We might form a "user group" for this purpose.

Last I heard, David was still getting a small amount of Shareware revenue from OmniCom and did not want to release the source code on that program for awhile yet. -John Sangster SPHINX Technologies, Inc. / (315) 446-8800 / (617) 235-8800 Please send e-mail on this to jhs @ cat.acs.syr.edu

4763. Help needed

Newsgroup: comp.sys.atari.8bit

I did a lot of debugging this weekend on EMAX, and I think I've discovered my problem: keys typed too fast cause the system to crash.

My circumstances are follows. I am using the XEP80, and am placing most of my program (a text editor) in RAM under the ROM. I am running under MYDOS. Interrupts (maskable and NMI) are shut off while ROM is off.

The vast majority of the code resides in RAM under the ROM. I still use ROM, though, to do I/O. When CIOV is called, instead I jsr to routines in low RAM to switch in ROM, turn interrupts on, then jsr to the real CIOV. When CIOV returns, after saving registers and CCs I disable interrupts, turn ROM off, restore regs&CCs, then return to EMAX.

I use the K: driver assigned to channel 2, not the E: driver, for keyboard input.

As I say, all functions operate as expected until a long period of time is consumed [such as a search starting at the beginning of a long buffer and the string is not found, or something that pushes a lot of data in the buffers around, while in RAM (note interrupts are off during this time)] and (tough to say how many) keys are hit before EMAX calls for keyboard input. All I can say is, if I always wait for it to be ready before pressing any keys it seems to be fine.

Dropping keys in a overrun, although messy, is not too bad once you get used to it; but the system crashing (the most frequent symptom is it just goes dead) is pretty tough to live with.

I guess if I knew what the hardware does with the keyboard scan while interrupts are off, that would help; of course, any and all comments on the subject are welcome.

Don't say "try calling Atari." :-)

Thanks in advance!! -Stan

The messages to follow were sent out previuosly over CSA8 but for some reason never made it to naucse/IA8. Sometimes postings make it, sometimes they don't. One of these messages, I already sent twice. I sure hope they make it this time. I tried to send them directly to IA8.naucse but was unable to even get a line to naucse today. Man, I sure wish this systyem wasn't such a black box!
Messages to follow.....

4765. SUPER VIDEO/ RAMBO/ FRAZER

Newsgroup: comp.sys.atari.8bit
Date: 1991-11-18 20:26:28 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9111182026.AA07286@smithkline.com>
Source record: 113270

From: PHVAX::POEHLAND 8-NOV-1991 17:53:23.79
To: INET::"comp-sys-atari-8bit@ucbvax.berkeley.edu"
CC: POEHLAND
Subj: Super Video/RAMBO/Frazer

My apologies for answering email on this net. I tried to send email responses, got bounced.
Bill Hutchison, thanx for your comments on Super Video. The photos turned out much better than I anticipated. Small as they were, they were all reduced from 8x10 B&W glossies. The printer did it, I don't know how. The circuit board photo had an almost 3-D quality to it.
RE: RAMBO, I highly recommend it if you can still find it. I understand ICD is sold out, but Best, ATV, B&C, or SAn Jose probably still have it. Also maybe Toad Computers in Severna Park MD, they bought up a lot of ICD stuff at the WAACE fest last month.
Most people don't realize RAMBO is an exact duplicate of the Claus Bucholtz "Quarter-Meg Atari" upgrade published in 1985 in BYTE magazine. The schematics were also published in Current Notes in 1986 by Bucholtz. I revewrse-engineered a RAMBO board last year in comparison to published schematics & found it identical to the Bucholtz designs, even down to the chip & component designations!
All five of my 800XLs are fitted with RAMBO. In my installations I soldered the wires to connectors that can be quickly detached from the motherboard in case of failure (I *despise* soldering anything directly to chip pins!).
I've never had a RAMBO board die on me, but I did experience one spectacular 256K DRAM failure during burn-in (with new equipment or installation of an upgrade, I boot it up & leave it on for a solid week before I place the unit in service).
The only incompatibility I've personall observed with RAMBO occurred when I demoed the new CghromoCAD program from Palette Imaging. ChromaCAD runs video ou out of ANTIC, which is what the 130XE apparently does. RAMBO runs video from th the CPU. There might be other differences also.
Oh yeah, Bill, don't be surprised to see your letter appearing in the letters column of Current Notes.
Hello Chris Chiesa, Frazer PA is a flyspeck on the map about 25 miles due west of Philadelphia. My house (or what's left of it) is spitting distance from Immaculata College. Sorry, never heard of Johnsonburg. I know at least one other 8bitter in Rochester, plus any number inSyracuse.

4766. 1050 DRIVE ALIGNMENT

Newsgroup: comp.sys.atari.8bit
Date: 1991-11-18 20:39:14 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9111182039.AA07344@smithkline.com>
Source record: 113271

From: PHVAX::POEHLAND 8-NOV-1991 15:28:54.72
To: INET::"comp-sys-atari-8bit@ucbvax.berkeley.edu"
CC: POEHLAND
Subj: 1050 Drive Alignment

In IA8V91#84 AKH104@PSUVM (sure would like a name there) suggests download-
ing the 1050 drive diag prog from compuserve & use the software to align the
sensor.
I was unaware the software was available online, but I do agree with this
suggestion. I had occasion to use the diag program this past weekend (before the
fire) & saw that sensor alignment didn't require a scope. You just move the
sensor around until it says OK. I've never had occasion to use it, as I always
made ascoremark first.
I think it will work, but it's tedious. Mostly because the sensor in-
variably ends up moving while you're tightening it down If I aligned a sensor
that way, I wouldn't trust the drive until it had passed the 10-min burn-in test
in the diag prog, plus also had passed compatability tests with at least 2 othert
known good drives.
The diag program is probably worthless if you only have one drive, & that's
the one that needs aligning. You need at least one known good drive to load in the
the test program. Then disconnect the good drive & boot up the misaligned one
to do the job. If the bad drive is already pretty close to correct alignment
you might luck out & be able to load the test software with the bad drive.
I got the diag prog some years ago from B&C. It might also be in the 8bit
library on GEnie.
About the time I was fighting the fire in my house Jean Goulet sent me
email expressing concern about the drive in question being equippeed with
U/S Doubler & noting the drive already had a Tandon mech. (Sorry for the delay,
I've been distracted the past few days (!))
I'm not 100% sure of this, but I'll take a stab at it. If your original
mech was a Tandon & you replace it with a Tandon, no problem, the U/S-D ROM
will work fine. The only thing you need to concern yourself with is the RPM
adjustment on the new mech. The RPM.COM utility in SpartaDOS is just fine for
this. (I also use the RPM utility in DOS 2.6f, but Sparta's is better.) The RPM
M adjustment screw is right in front of the area in the rear of the drive where
all the connectors plug in, near the 2917 tachometer chip.

*** NEVER *** attempt to adjust ANY of the pots under the RF shield!!!

If the original mech was a WST type, the drive is equipped with U/S-D, &
you plug in a replacement Tandon mech, my gut feeling is that it should still
work, but since I haven't done it myself I won't swear to it. You'll still need
to adjust RPMs on the new mech.
The 1050 diag software doesn't work on 1050's containing U/S-D. If you
want to run full diags on a U/S-D drive, you have to pull out the ICD chips &

replace the original chips. If there was a jumper change when the U/S-D was installed, you have to desolder the jumperts & put them back in their original positions. Fun, fun, fun!
Of course, if you trashed the original chips, or failed to note the originl jumper configuration, you got a helluva headache.
I was in the process of investigating the ROM/jumper situation the weekend of the fire. Dunno if I'll ever get back to it now.

4767. Where Are We Going?

Newsgroup: comp.sys.atari.8bit
Date: 1991-11-18 20:40:29 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9111182040.AA07348@smithkline.com>
Source record: 113273

From: PHVAX::POEHLAND 29-OCT-1991 12:21:09.47
To: INET::"comp-sys-atari-8bit@ucbvax.berkeley.edu"
CC: POEHLAND
Subj: Where Are We Going?

The 8bit disaster at the recent WAACE show in Virginia, & the makings of another disaster in the forthcoming Chicago event, have filled me with a sense of alarm for the future of the 8bit community.
My efforts to recruit new 8bit scuscribers to CN have been mostly a failure . The number of new subscribers coming in has not balanced subscribers who are leaving, despite the enthusiasm which my efforts have generated among the faithful. Most 8bitters still view CN as an ST medium, & I must acknowledge the veracity of that opinion.
Support from the vendor/developer commun ity has nearly dried up. The primary measure of vendor support is the amount of print media advertising they place in magazines. And people, the number of column inches is way, way down compared to a year ago.
Atari has abandoned us completely. So has ICD. I returned home from the WAACE event feeling like a Pariah. The ST people think wer'e all a bunch of idiots for continuing our interest in these slow, worthless, obsolete, useless machines, & no longer feel constrained to withhold their contempt for us.
I am only just now realizing how devastating to our community was the loss of ANTIC. Not only did we lose our most well-known forum for expression, but the community also lost its identity. I had hoped Current Notes would move to fill the void, but that hasn't happened & I now know it won't ever happen no matter how many software reviews or hardware hacks I contrive. The reason being , that along with falling subscriptions, falling vendor support/ads, & abandonment by
Atari, so also have the Powers That Be at CN have lost their enthusiasm for 8bit coverage. In short, I have been taking a long walk on a short pier; I shall soon find myself bare-assed & soaking wet.
I have identified what
I feel are several issues that we sould address if we are to continue to exist as a viable entity:
1.) We need to formally recognize the division between the ST & 8bit communities that has existed ever sice the ST appeared on the market.
2.) We need to mentally dissassociate ourselves from Atari. Atari doesn't give a damn about us any more. Atari scorns us & labels us "cheapskate" because we didn't trash our 8bits & run right out to buy an ST, or TT.
3.) We need our own magazine. All 8bit, no ST/TT. Run by a mature responsible adult who is financially secure, knowledgeable of the machine, & has the people,& temporal resources to devote to it.
4.) The laid-back attitude on the part of vendors, wherin many of them don't seem to care whether they sell product or not, has to go. In a declining

market the vendors should become more *agressive*, not more lackadaisical
5.) The progamming community needs to broaden its horizons. The good ole
days of cutesey utilities & video games just doesn't cut it any more,
people. Look at ANTIC. Even in their last issues, when they had to
combine with STart for survival, they were still serving up the same pap
that was their stock in trade since 1982: utilities & games. What is
needed to keep this computer alive is new APPLICATIONS. Useful, prod-
uctive things people can use the machine for.

I challenge anyone to go into a storefront outlet that sells software for
the C-64 (yes, they still exist, at least in my area). The variety of application
applications is amazing. Much of it is just as professional as anything for
the Mac or IBM clones. But where is the serious Atari 8bit software? A few
years back there was a big hoopla when NEWSROOM came out for the 8bit. But
the graphics supplied with it sadly revealed the attitudes at work: cutesey
little comic-style graphics. And we wonder why ST users of Calamus sneer at us.
With good reason: DTP for the 8bit is a joke.

A few weeks ago in this forum I proposed a chemical graphics program for
the 8bit. The response was sadly typical: it couldn't be done because the
aurthor couldn't charge $500 for it. No one even inquired what a chemical
graphic was. I'm not much of a programmer, but I do know that chemical graphics
would be relatively esay to do. A helluva lot easier than ChromaCAD whose
author is already making a profit at $29.95 a pop.
How about another area that offers potential: electronic schematic graphics.
Surely this is closer to home for some of you. There are at least 3 programs
that purport to draw schematics on the 8bit: Graphic Master, Schematic Designer,
& Circuit Database. Try using any of those programs to produce camera-ready
artwork: you soon discover all of them are crap. They don't have enough
symbols, the printouts occupy only 1/8 of a page, the graphics are blocky, &
most of them have serious problems with aspect ratio in the print. Why not a
program that uses the XEP-80 to draw a full screen with a 24-pin screen dump &
use of banked XE RAM to store symbol libraries?

Still too mundane? How about this: an Alpha-brainwave generator. A soft-
ware/hardware gizmo your computer uses to generate very precise low-freqeuency
brainwaves. Output thru headphones. Twenty minutes of sbjecting yourself to
this treatment, you come out feeling like you just had a good night's sleep.
Nirvana without drugs! It has been already, published a few years ago in the
Computer Digest section of Radio Electronics for an IBM clone.

So folks, if all you want to do is copy 5200 videogames to your XL, do so
in the knowledge the rest of the world is laughing at you. The time has come
for us to grow up & get serious.

Grow up, or die.

4768. Re: (none) (APACVIEW and COLRVIEW)

Newsgroup: comp.sys.atari.8bit
Date: 1991-11-18 22:53:03 UTC
From: potter@sundae3.dab.ge.com
Message-ID: <1991Nov18.225303.18933@ge-dab.GE.COM>
Source record: 113275

Guys,

I'll be at the Chicago Computerfest (11/23-24) with new releases of both COLRVIEW and DEGASRD. Both add the ability to enter a directory mask, and let the program cycle through all pictures on your disk in a "slideshow" mode. COLRVIEW, if you haven't heard, views picture files created from GIFs in 4096-color or 64-color modes. DEGASRD (not the same as Matt Ratcliff's DEGASVU) allows you to view ST pictures created by Tom Hudson's Degas (or Degas Elite) in either graphics 9, 15, or COLRVIEW modes (4096 or 64 colors).

Any Atarians attending are also urged to come by my booth ("AGDA") or Chuck Steinman's booth (DataQue) to let us know you are around. Chuck is planning to have an informal get-together with eight-bit users and developers over dinner on Saturday night. See you there!

Source record: 113289

In response to Ben's comments and suggestions, I would like to post some of my own and reply to his.

His points are very legitimate and well made. Constantly I am ribbed by IBM PC Owners here on campus who tell me to get a real machine.
The machine is real, it's the software that's not the hottest. Example: This guy uses Wordperfect on his new 386, the same program with the same setup he used on his Tandy 8088 laptop.
The 8088 XT is not very sophisticated and if a program the calibre of Wordperfect can run on THAT, similar applications can run on the Atari 6502. In fact if I remember correctly Wordperfect WOULD HAVE written Word Perfect for the 8 bit way back when if enough people had written in. It's not that the machine is incapable, it's that it lacks software to make it capable.
I have been hoping Textpro version 5 would come out sometime soon, as I would personally be more able to add or modify a program with hooks and stuff already in it than to hack at source code. Unfortunately I haven't heard a thing from the author on GEnie for months, so who knows where Textpro is. My thoughts have turned to Omniwriter. It's already written for 80 column and extended memory, but it needs a massive update. It pales compared to Textpro's features.

I bought Schematic Designer way back when and came to the same conclusion Ben did, a graphics 8 screen isn't good enough. Need higher resolution.

I currenly own a new Epson LQ570 printer, which even supports scalable fonts, but there is no software to take advantage of this. It would be easier to program and run faster than DDIII would. By the way, that guy with the 386 couldn't believe my Panasonic 9 pin could produce the output it did with DDiii. He even asked if it was available for the PC. Hats off to Roy Goldman.

If you really like the Atari 8 bit platform but are looking for a more powerful processor or more memory that can be addressed DIRECTLY, instead of like the 130XE banks, there is the Turbo816 from Dataque.
I have it and 288K worth of RAM for it as well as a clock chip and its development package. I haven't used it though because I simply am not hot at machine language. There are also some hardware incompatibility problems here and there with the T816 board, and it is still 1.79Mhz.
Okay, well if enough people are interested, Chuck Steinman is prepared to make a 1600XLE motherboard, which would contain a 8mHz 65816.
It would have iBM type slots to plug in cheap easily accessible graphics cards, hard drives, floppies, etc. It would also have the standard SIO for the regular 8 bit peripherals. GTIA/ANTIC graphics wouldn't be supported, VGA graphics would. This is designed as an applications

screamer. It would run as fast as a 22mHz ST or 286 machine.
Interesed? All it takes is $250 from 16 people and he will be convinced
to make the motherboards.... I am trying to get him to send me a complete
ASCII file with details to upload here and I will post whatever I get ASAP.

Compilers, boy could I use a good one. I crashed CLSN Pascal and
Faster Than Lightspeed C is not that good. Action? I don't have it,
don't know if I can even get it anymore, and would rather get a good C
or Pascal compiler. Chuck Steinman has been promising one of these too,
but is having problems with the structs and unions.

I keep saying I am too busy with College right now to put any serious
effort in producing any kind of program. Plus I am only beginner class
when it comes to Machine Language. Maybe I can work a little harder, can
anyone else do the same?

Even without a 65816 runnning at 8mHz, the 8 bit is a capable machine.
It has to be, or the Apple //e wouldn't still be around in thousands of
schools pumping out all kinds of educational software and professional
quality applications.

Well, that's all I have to input for now, I think I've blabbed enough.
I would REALLY like to hold onto my 8 bit a little longer. But
like Ben a lack of serious applications may force me to look elsewhere
for my needs, and I only have money for one machine at this time.

Source record: 113274

Hey atari dudes...

I have a large number of disks for my 8 bit, and am concerned about
their about the lifetime and durability. Alot of the software, games
etc, are real clasics, I think.. soft. engineers realy put their heart
and soul into games like Synopse's Zeppelin, for example.

What mediams have people out there saved their software on? I have
thought about getting a hard drive hook up for the atari, but am
also interested in looking into kermiting the software to a unix
workstation and then saving it on tape.

Have any hackers out there thought about connecting an atari to a serial
line on a terminal server, and say use SLIP to feed files off of an
ethernet lan into the atari?

Lets preserve that awesome software! They don't make 'em like they
used to.

Dan Lambright
dan@gordian.com

This article was quite and interestinf one to read, and compliments my views exactly. I am an 8-bit supporter here in the Uk, where support is not too bad, and where there are plenty of users. There is an 8-bit only magazine here in the UK called Page 6/New Atari User, which is run and edited by people who have been around since the early days. They do US subscriptions as well. Their address is: Page 6, PO BOX 54, STAFFORD, ST16 1DR, ENGALND. Also, I produce an on-disk newsletter which goes out to about 20 people. Hopefully you should have received my other article about Digi-Studio my new product for the Atari, so I won't go into it here. I will continue supporting the Atari for many years to come, and will continue working to bring new software. I have no time to play games on my machines. I want more from the Atari, and I try and bring more by releasing my own software. I also have other people in the UK working on new software for me, which I am also hoping to release next year. I will do my best to make all this easily available in the US, and possibly other countries as well if there is a demand. Long Live the Atari 8-bit!!

4776. Re: Where Are We Going?

Newsgroup: comp.sys.atari.8bit
Date: 1991-11-19 15:12:06 UTC
From: exuhag@exu.ericsson.se
Message-ID: <1991Nov19.151206.25549@exu.ericsson.se>
Source record: 113276

Ben Poehland brought up some good points, but there are a few larger issues to worry about.

(1) Where can Mr. Average Joe buy Atari equipment, now that it has been officially dumped by Atari? In order to put together a decent system you have to bascially root through dumpsters to find the appropriate used components. There *is* a market for a very nice low cost computer system for handing useful applications, but if you can't walk into a store and buy an Atari XE, then no one is going to.

(2) Along the same lines, there doesn't seem to be a way to expand the Atari 8-bit user base. There are no new users, and eventually the old-timers will give up and buy a PC clone.

(3) No available places for service. If a machine breaks down, you have to fix it yourself, provided you have enough documentation to know how. Most Atari machines are rock solid, but disk drives are another story. If Atari machines are to continue, there needs to be an easily obtainable and *inexpensive* (around $100) IBM compatible 3 1/2" drive. And just using 3 1/2" disks would give a bit more respectability to the machine. The 1050 has to be completely eliminated.

(4) The status of all that old software needs to be resolved, including stuff published in Antic, ANALOG, and COMPUTE!. If any of it goes public domain, there should be someone, or an organization, which takes the time to catalog it, make sure it works on all machines and has proper documentation, and distribute it via mail order and BBS. Public domain needs to be explicitly marked as such to prevent copyright confusion in the 8-bit world; it may lead many people to believe that you can copy anything.

As Ben noted, an 8-bit magazine is desperately needed. Atari Interface is a fairly nice little magazine, but it is split between the ST and the 8-bits and could use a bit of polishing. (Question: why does everyone think that the 8-bits and STs have something in common?).

And 8-bit software really does need to move ahead if the machines are to have a future. Geez--anyone ever notice that the same articles and programs kepts repeating during Antic's final few years? Another stupid random number door prize program, a simplistic joystick-based drawing program, a tic-tac-toe game, another Tetris clone. Bleah.

Why am I saying all this? Well, I used to be a die-hard Atari user, and I used to write for Antic and ANALOG, and I just plain *like* the 8-bit computers. I programmed an 800 from 1982 to 1988, then

"officially" moved to the PC world (I had been using one on the side since 1984). I really miss the simplicity of the 8-bit machines. On the PC, things are so contrived--you have to go through all sorts of contortions to do anything, whereas on the 800 there is usually a nice simple little way of solving the problem. This lets you concentrate on writing applications and such, without having to worry about how to work around the hardware. I really wish that the 8-bit market would settle down and grow, but in all honesty I don't think it is ever going to happen. Sigh.

Comments?

Ben, you are certainly justified in your anger over the demise of the Atari 8bit. I myself have an 800 that I paid $900 for many years ago. It is a -great- machine. I feel the reason it didn't get as much respect as it should was because people heard 'atari' and thought 'video games.' (Atari didn't do too much to change this either..)

However, we just have to face facts here. It is nice to be nostalgic (sp?) but there are no real reasons for anyone to support the atari anymore.

Develop software for it?? Why? What? -ANYTHING- that could be developed on the Atari, could be made better on a 386 machine. The performance standard has risen. It is the same philosophy that the car industry runs on. Auto manufacturers do not still support 1940 auto's. Why should they. The only people who still own them are enthusiasts, and they are resourceful enough to dig up their own help. The market is simply not there for 1940 era auto technology.

Sure the Atari market has shrunk, but it is not like the trend will continue until there is NO ONE around talking 8 bit. There will -always- be enthusiasts like us to talk and keep it alive. Usenet and the like are exactly the forum that will keep it alive also.

Don't let it bother you too much that atari support from the business end is just about dead. They are there to make money, not support a few die-hards like us....

It is up to -us- to keep it alive, however possible.

God bless our souls....

4778. Re: 8 bit and hard drives

Newsgroup: comp.sys.atari.8bit
Date: 1991-11-19 18:21:24 UTC
From: JJMCWILL@MTUS5.BITNET
Message-ID: <91323.132124JJMCWILL@MTUS5.BITNET>
Source record: 113293

There are several ways to hook up hard drives to the Atari 8 bit computer.
The two most popular interfaces are the MIO from ICD which will now be
be almost impossible to find; and the Black Box from C.S.S. With either
one of these you can have at least 128megabytes of hard drive storage
connected, with the Black Box you can have even more.
Remember though that protected disks will have to be unprotected and then
compacted into a file. The programs Black Patch from CSS and Chipmunk from
Alpha Systems (I think) will unprotect certain disks and make them copyable
for archival purposes. Then from there you can use Bob Puff's DiskCommunica-
tor to turn the disk into one large file. Then use his Superarc program
compact the file.

To my knowledge there are two other hard drive interfaces around, but I haven't
heard of them in a while. The Supra interface was bought by someone, and I am
not sure who. There was another interface also which appeared in Antic but
the name alludes me. I suggest the Black Box, it has a future unlike the
other interfaces.

As mentioned and discussed in previous postings, SIO2PC is a hardware
device that would let you store unprotected diskettes as files on an IBM
PC computer.

Keep in mind all hard drive interfaces require an 800XL, 600XL, or
130XE to connect to them. Or the 1200XL :).

Hope this helps.

Regarding only James Hague's point about needing standard IBM drive mechs. Buy an XF551 if you can get one because it uses the standard IBM 5.25" 360K floppy drive mechanism. It can also be upgraded to 3.5" 720K without much hassle. Or look to the upcoming Black Box floppy controller which will allow you to hook up IBM type 360K and 720K disk drives and read and write to them fast.

I don't know if this group has a FAQ list, so please excuse my naivete
about this...
What exactly is an 8bit?
How can I tell if I have an Atari 800 or an 800XL? What are the differences?
I have a computer communications cartidge for my Atari. Does this act as an
emulator for a modem connection?
Does the Atari 800 require a special Atari modem? Or could I buy most any
modem for it?
Thanks, MJC

>you plug in a replacement Tandon mech, my gut feeling is that it should still
>work, but since I haven't done it myself I won't swear to it. You'll still d

If you switch mechs like that you are going to have a neat time! I did this
once to see if my drive mech was out of alignment or if there was something
wrong with the board. First of all it acts very wierd...most likely the
speed pot will have to be adjusted...also..careful when pluging in the
head connector header. The pins on different boards are of different
diameters and you could easily (as I did) push the connectors out of
the headers and mangle them. I however dropped this attempt at swapping the
mech. Last I heard you could buy WST mechs for $60 and Tandon for $45.

One last thing..."NEVER adjust the pots under the RF shield?" Hmmm..
what if some unsuspecting person did actually "tinker" with these???
How does one correct the problem? I have both the Atari and Sam's manuals.
Neither give explicit detail on "adjusting" them. 8-)

Thanks. Oh..its Andrew. Andrew. K. Heller.

> EMAX.

Why don't you let the IRQ's and NMI's be serviced as they happen? The vectors are up at $FFFA-$FFFF, along with the RESET vector. Patch them to point to your code low down in RAM, and have that handler flip the OS in, service the IRQ or NMI, and then flip your software back in. For example, the IRQ handler might look something like:

```
Install:
flip in RAM

LDA $FFFE
STA Low_IRQ+.1+1
LDA $FFFF
STA Low_IRQ+.1+2

LDA #Low_IRQ
STA $FFFE
LDA /Low_IRQ
STA $FFFF

RTS

Low_IRQ:
SAXY
flip in ROM

PHP ; IRQ handler will do a RTI from our JSR
.1 JSR Old_IRQ ; modified by Install

flip in RAM
LAXY

RTI
```

Repeat the above for NMI and RESET, and away ya go.

Ok, this is off the subject, but what aould it take to put a 3.5" mechanism in a 1050, but only use it like Single sided/double density? What all does IC's 3.5 conversion for the XF551 consist of? (A new ROM and mech?)

James Hague writes:

> [Lots of good points about the future of the 8-bit.]

Concerning the copyright status of Antic and ANALOG programs:
ANALOG, by my understanding, never took control of the copyright.
They printed all my programs (I'm Greg Knauss by the way, on a
friend's account) with my copyright in place, buying first printing
rights, according to the contract. I read that as meaning they're
my programs again, to do with as I wish.
Antic's a different story. They put their own copyright on
each program but from the rumors I hear, Antic Publishing, Inc. is
about to file for bankruptcy protection and eventually re-emerge as
PC Home Journal Corp. I don't rightly know what happens to the
copyrights in that situation, but since Antic Publishing no longer
exists (or will no longer exist soon in the future) can it hold
copyrights? Either way, I don't think they'd much care.
Are there any lawyers out there?

From: entropy@gnu.ai.mit.edu
Message-ID: <ENTROPY.91Nov20193557@wookumz.gnu.ai.mit.edu>
Source record: 113282

Hello...I have just acquired a used 850 interface without a manual.
So, I need pinouts for the R: ports. I remember vaguely that each
port has slightly different pinouts and features, so a listing for
each would be nice. A pinout for the parallel printer port would be
appreciated but I don't really need it right now.

Mail replies are preferred but followups are OK as well.

Thanks in advance,

Hi all.

I have been using my 800XL on an old TV for some time now. Last weekend, I bought an Amdek (sp?) color monitor for $15. It works great! I would like to connect it to my 800XL.

Here is my problem. I don't have the pinout of the DIN jack on the 800XL so I don't know the pins for the audio and the video!

Could someone please help me find that information? I am nervous about just connecting wires up and moving them until something works.

Thank you in advance for your help!

4789. st to 8-bit file transfers

Newsgroup: comp.sys.atari.8bit
Date: 1991-11-21 16:27:50 UTC
From: LENNJM@PURCCVM.BITNET
Message-ID: <91325.112750LENNJM@PURCCVM.BITNET>
Source record: 113286

I've been trying to transfer some 8-bit files that were downloaded
to a 520ST back to my 800XL. I've tried over the phone with using
SX212 express on the 8-bit end and Uniterm on the ST end. I tried both
CRC and CHKSUM X-Modem protocols.
Since that was unsuccessful, I tried using a null modem between the
two computers. This was also unsuccessful.
Could someone post the correct method for transferring files from
the ST to the 8-bit.
On the 8-bit end I have an SX212, SX212 express, and Amodem 7.4
On the ST end, I have available a Volksmodem 520, Uniterm, ST-Talk,
and XYZ.

Thanks

Jody M. Lenn

bboychuk@sdcc13.ucsd.edu (The Fightin' Llama) writes:

>copyrights? Either way, I don't think they'd much care.
> Are there any lawyers out there?

Really, I do not think I would face a moral delima if I was confronted with the possibility of copying a program that ANTIC has copyrighted. Ok, so, in the pure sense of the law it's illegal. But let's be realistic here. You are not distributing it for money. They are not losing any money. No one loses.

Right now, I have no problem what-so-ever copying any 8bit games. 99.99999% of the games I will copy are no longer even sold. Again, no one loses.

Not to start this thread again, but copying of video games is so rampant because Software Companies do not follow basic economic principles when making their games. They over-price the shit out of them. $50-$500 - give me a break ... Then they figure out how many pirated copies there are and say "Look! we have lost 44 billion dollars, because there are 500,000,000 pirated copies of our programs out..." This whole notion (the same one record companies use) is a crock of shit. 90% of those pirated copies would not exist if people had to pay for them. I used to pirate a myriad of atari software (we would always get games before they hit the shelf..) and 90% I wouldn't pay $1.50 for. However, if the software was priced resonably, I would be more than happy to pay the cost to get the docs and related material...

Anyway, on ANTIC software, if anyone has any qualms about copying ANTIC software, they are really uptight...

>of like the 130XE banks, there is the Turbo816 from Dataque.

{...}

>screamer. It would run as fast as a 22mHz ST or 286 machine.

Ah, isn't this a little exaggerated? I can't see an 8Mhz 65816
outrunning an 8Mhz 68000, let alone running almost three times faster!
Don't forget, the 68000 has a sixteen bit bus and thirty-two bit registers
and the '816 has an eight bit bus and sixteen bit registers. The only
case I can see where the 816 would outrun a 22Mhz ST would be using Antic
character modes (the ST must bit block the text, but with a BLiTTER, the
ST is a little faster)

4792. Re: 850 R1-R4 port pinouts needed

Newsgroup: comp.sys.atari.8bit
Date: 1991-11-22 01:02:16 UTC
From: whoffman@jato.jpl.nasa.gov
Message-ID: <1991Nov22.010216.8729@jato.jpl.nasa.gov>
Source record: 113297

This was requested by someone on the net and so I thought I would
post it. For me, sometimes it is easier to retrieve the electronic
version of documentation rather than hunt in the garage. :-)

Ok, here goes...

There are four ports on the 850 for serial communications.
Looking at the ports, the 9-pin ports are numbered below:

```
5 4 3 2 1
9 8 7 6
```

The pin assignments are as followed:

```
Port 1: Maximum featured port
Pin 1 -- Data Terminal Ready (DTR, Ready Out)
Pin 2 -- Carrier Detect (CD, In)
Pin 3 -- Send Data (Out)
Pin 4 -- Receive Data (In)
Pin 5 -- Signal Ground
Pin 6 -- Data Set Ready (DSR, Ready In)
Pin 7 -- Request to Send (RTS, Out)
Pin 8 -- Clear to Send (CTS, In)
Pin 9 -- N/C
```

```
Ports 2 & 3: Limited port (no CD, RTS, or CTS)
Same as Port 1 except Pins 2,7,8,9 are N/C
```

```
Port 4 : RS/232 and 20 mA Current Loop
Pin 1 -- DTR *always ON (+10V)
Pin 2 -- N/C
Pin 3 -- Send Data (Out)
Pin 4 -- Receive Data (In)
Pin 5 -- Signal Ground
Pin 6 -- N/C
Pin 7 -- RTS *always ON (+10V)
Pin 8 -- N/C
Pin 9 -- (-8V)
```

```
To use with 20 mA loop device:
1 - Send Data +
3 - Send Data -
7 - Receive Data +
9 - Receive Data -
```

The 15-pin printer port is defined below:

```
8 7 6 5 4 3 2 1
15 14 13 12 11 10 9

Pin 1 - Data Strobe (active LOW)
Pin 2 - Data bit 0
Pin 3 - Data bit 1
Pin 4 - Data bit 2
Pin 5 - Data bit 3
Pin 6 - Data bit 4
Pin 7 - Data bit 5
Pin 8 - Data bit 6
Pin 9 - Data pins pull-up (+5V)
Pin 11 - Signal Ground
Pin 12 - Fault (active LOW)
Pin 13 - Busy
Pin 15 - Data bit 7

Note: *FAULT must be +5V for printer port to operate. If your printer
has nothing appropriate to connect to FAULT (such as +5 V or
some ONLINE-type signal), connect Pin 9 to Pin 12.

4793. The Cleveland Free-Net Atari SIG

Newsgroup: comp.sys.atari.8bit
Date: 1991-11-22 01:55:05 UTC
From: aa700@cleveland.Freenet.Edu
Message-ID: <1991Nov22.015505.19905@usenet.ins.cwru.edu>
Source record: 113296

As members of this group are discussing how to make due with the shrinking world of 8-bit Atari users, let me remind you of one resource that is GROWING!

The Cleveland Free-Net Atari SIG includes an 8-bit support area that features:

o Z*Magazine, the 8-bit Atari online magazine that Ron Kovacs continues to produce.
o The comp.sys.atari.8bit message base, in Digest format.
o Product reviews and summaries, whether original or reprinted from Z*Magazine, Current Notes, or c.s.a.8bit.
o Tips and Tricks by fellow 8-bit users.

The 8-bit support area is just a small portion of the Atari SIG, which supports the entire range of Atari computers and game systems. Features relevant to 8-bit users include:

o A Wanted/For Sale board.
o A Programmers forum, coordinated by a professional programmer.
o Z*Net and STReport.
o Organized access to the files available at the atari.archive.
o New product news.
o Atari Corp. news.

To reach the Cleveland Free-Net:

If you have Internet/telnet access, you may telnet to freenet-in-a.cwru.edu

Or with modem, dial 216-368-3888.

You may apply for an account once you're connected, or you may explore the system as a visitor. There is no charge to use the Free-Net!

Once connected, be sure to "go atari" or "go atari8".

Feel free to e-mail me with any questions or thoughts, or follow-up here.

See you on Free-Net!

4796. Re: DAMARK Modems

Newsgroup: comp.sys.atari.8bit
Date: 1991-12-20 03:34:19 UTC
From: JJMCWILL@MTUS5.BITNET
Message-ID: <91353.223419JJMCWILL@MTUS5.BITNET>
Source record: 113298

I remember just the other day looking through one of the Atari publications and seeing one with an ad that had the SX212 modem in it but I can't remember who, maybe San Jose or B&C but they were about $40 which wasn't that cheap unless you really need the SIO port instead of using the standard RS232 interface.

The item number for the modem in Damark was 181504. I ordered one on the 29th of October :) I traded it to a guy in my hometown for some other hardwar e though..

4798. The Article You'll Never Read In CN

Newsgroup: comp.sys.atari.8bit
Date: 1991-12-20 23:41:21 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9112202341.AA16805@smithkline.com>
Source record: 113212

I keep forgetting which nets accept plain unformatted ASCII text & which
ones require CR's at the end of each line. Seems some folks on some nets got
a garbled version of the article (it looked a little weird when it came back
to me on DECNET, but it was all there).
I don't have time to reformat the entire article. If someone wants to
download it with KERMIT, stick in all the CR's, then upload it to the Net
again, let me know & I'll try to email the ASCII file to you.
From my site I have access to INTERNET, BITNET, UUNET, & MILNET. If you
are on another Net I can't access & send me mail, I might rcv it OK but not
be able to answer you. This makes the sender grumpy & the receiver frustrated.

4802. Re: Digest on CIS

Newsgroup: comp.sys.atari.8bit
Date: 1991-12-21 09:04:58 UTC
From: aa700@cleveland.Freenet.Edu
Message-ID: <1991Dec21.090458.24100@usenet.ins.cwru.edu>
Source record: 113213

In a previous article, 71450.1050@CompuServe.COM (Lawrence Estep) says:

>This is just a note to let everyone out there know that the Info-Atari8 Digest
>is now available in the Atari 8-bit Forum on CompuServe. They are uploaded
>to the forum as they come out, and they are generating alot of discussion
>and interest from the users online.
>
>-Lawrence Estep

I think this is an extremely important step, and I'm glad to hear it being done.

Just as we try to combine the various hard-copy publications covering the 8-bit Atari into a single publication dedicated to our machines, I believe it is also very desireable to unite the various online groups as well. People on Usenet, CompuServe, GEnie, Delphi (I'd like to include the Cleveland Free-Net among these) need to be aware of one another. I'd like to see someone volunteer to cross-post this Usenet message base, in Info-Atari8 Digest format, to each of the other services, as Lawrence does to CIS and I do to Free-Net.

Mind you, I've never been on any of the pay-services, but might it be possible to create "Digests" for each online group? Ideally, I can imagine a single posting to, say, GEnie, that would within a short period of time reach all the other groups as well.

Does this seem remotely feasible?

> reading this chances are that you are on Usenet), chances are that it
> is a Unix machine. Most of the Unix vendors now assume that the
> default printer understands PostScript. [...]

Careful about those assumptions! Lots of us are on machines running VMS,
and I'm not sure what you mean by "Most of the Unix vendors", but the
only things assumed by the Unix systems I work on (Ultrix, SysV) about
the default printer is that it understands ASCII (except for troff output,
which wants a phototypesetter I've never seen mentioned outside of troff
documentation). If it's decided to go with Postscript, I would like to
encourage production of a dumb-ASCII version as well - but if you are
going to do printer graphics, my guess would be that Epson graphics would
be available to a greater percentage of the 8-bit community.

If someone is taking a tally, put me down as a subscriber to an 8-bit
publication; I got a lot of use out of my Antic and Analog subscriptions
while they lasted.

4806. WAACE Review/8-Bit Publication

Newsgroup: comp.sys.atari.8bit
Date: 1991-12-23 16:03:05 UTC
From: poehland%phvax.dnet@SMITHKLINE.COM
Message-ID: <9112231603.AA20310@smithkline.com>
Source record: 113301

Hello Colin,
If you'd like to use my article in 8:16, be my guest! CN sure as hell isn't going to print it! If you didn't get it all, let me know, I'll be glad to send it to you on a disk via snailmail. BTW, the version I uploaded to IA8 was the 3rd revision, much sanitized with names, etc. removed, but it made no difference to CN. (There is only so far I will go to stifle the FACTS, then I draw a line.)
Once again I reject Brian's argument that electronic media can substitute for print media. If that were true, networks would have put magazines out of business long ago. Like Brian, I am encouraged that the discussions in this forum are being cross-posted to GEnie & CIS, that does help broaden our distribution somewhat. But the fact remains that all of us modem phreaks- regardless of which net(s) wer'e on, constitute only a minority of the community probably no more than 20%. I am myself a member of perhaps the largest 8bit UG in the US (OHAUG), which has only one member on this Net & no one on the commercial nets that I know of. ANTIC/ANALOG tied together all elements of the community- users, publishers, vendors, & developers- that reached the vast hinterlands where electronic media either doesn't exist or isn't popular, a common forum to which all members of the community no matter how isolated, could relate. With the decline of print media the fringes of the community have been cut off, there is increasing isolation/fractionation, we are dying the slow death of attrition. The faithful who still inhabit these networks may constitute perhaps the largest piece of what was once a large & viable community. But don't make the myopic mistake of assuming the entire community, or even the bulk of it, is on the nets. All of us are just one chunk among many pieces of a fragmented society.
Colin expressed concern whether AIM would be our best bet. I must reluctantly agree that such concern is probably legitimate. Yet, when I considered the 3 main possibilities (PSAN, AIM, CN), AIM still seems to offer the most promise. PSAN is too local & with a sub base of only 800 does not have the resources. CN has a larger circulation (4200) but its Publisher is entirely preoccupied with the ST/TT market & has lost touch with the 8bitters. I see CN metamorphasizing into strictly a ST/TT mag, with increasing emphasis on the "TT" part (the inevitable consequence of its having a major columnist who develops TT products & writes about it in the magazine, etc.). Plus, a big disadvantage of both PSAN & CN is that they are not in the mainstream channels of magazine distribution. I also briefly considered the British publications (Page 6 & 8:16), but aside from distribution problems arising from several thousand miles of ocean separating the continents, the British mags have a parochial flavor that might not appeal to all segments of the highly diverse US market. (I personally enjoy 8:16 & New Atari User, but their circulation in the US is rather thin.)
So what does AIM have to offer? For starters, an 8bit monthly disk.
Then there was Bill Rayl's statement to me at the WAACE show, expressing his

support for us as long as we want it & continue to demonstrate it with purchases of disks/magazines. Third- & perhaps most important- AIM is sold on magazine stands in various bookstores, in shopping malls & other public avenues of mainstream exposure. A UG in Colorado picked up a new 8bit member who had acquired an 8bit & went looking for a magazine to tell him how to work it. The only thing he could find was AIM (from a mall bookstore). He looked up the UG list in the back og the mag, found there was one in the local area, gave the UG president a call, & bingo the 8bit community had a new member. THAT COULD NOT HAVE HAPPENED WITH ANY OTHER MAGAZINE, NOR COULD IT HAVE HAPPENED WITH ONLY AN ELECTRONIC NETWORK. It is true that AIM does have an ST bias, but it was my hope to neutralize that by splitting off 8bits into a separate mag whose editorial content would be in the hands of the 8bit user community. In other words, AIM would manage, print & distribute the mag, but editors selected from the 8bit community would determine its content.
I do not believe there is sufficient critical mass to start a new 8bit mag from scratch. AIM has name-recognition, a new publication would not. Just reaching all those isolated people to tell them of a new enterprise is a daunting task, but selling them I think would be impossible. The collapse of ANTIC/ANALOG left a residue of bitterness & suspicion that I think only AIM could pierce. I know CN could never do it. It was a source of almost constant frustration to me that no matter how hard I tried or how many 8bit articles got printed, the 8bit community still regarded CN with suspicion as an 8bit mag. What few subscriptions I did garner were the result of individual responses to me personally rather than support for CN asa a whole. But an independent publication supported by the resources of AIM & basically published by the 8bit community itself is an idea that lends itself to the broadest possible base of support.

Personally, I would have to oppose the use of PostScript for darn near anything anybody would care to send (or make available to) me. I have a damned difficult time getting PostScript output printed, although I can do it if I must. I first have to download to one or another of the systems I use at home (usually my Amiga or my Atari 800xl), then re-upload to the VAX at work, then DECnet to another VAX which has a Mac connected to it, then TCP/IP to that Mac, then tweak around with some sector-editor-type utilities on the Mac, then pull the result into Cricket-Graph (the ONE utility I've found capable of treating a raw PostScript "text" file as such, and damn lucky we happened to have it), THEN finally send it to the AppleTalk-networked LaserWriter and hope that Apple's version of PostScript is compatible with the author's (in about 50% of the cases I've handled, it ISN'T), the page-layout settings are reasonable for the LaserWriter (in about 50% of the cases it ISN'T -- I get things like 4" top margins and 4" of lost bottom-of-page text), etc. etc. etc. And this is the ONLY way I can even HOPE to print PostScript output, and relies on a lot of steps and machines that are frequently inaccessible, inoperative, and unavailable and are ALWAYS going to be SOMEONE ELSE's. Believe me, PostScript is only convenient if you've got a path from e.g. this network to a PostScript printer, and THAT can be very difficult indeed.

It sounds like Jeff McWilliams has at least as difficult a time as I do, printing (or trying to print) PostScript. I also neglected to mention that although The Portal System is a Unix (well, SunOS) -based host, its user interface does NOT offer "print" capability AT ALL, and even if it did, is located about 3,000 miles from me. Printouts would be a bit difficult to pick up even if I could generate them.

Source record: 113209

In a previous article, franho@max.u.washington.edu () says:

>
> I recently got an SX-212 modem for my Atari and was wondering if there
>are modem programs available that don't require an RS-232 interface (hookup
>to the Atari by the SIO port). I have an 850 interface for my Atari but my
>sister's Atari doesn't have one. I thought there were versions of Kermit
>and/or 850 Express! which could use the SX-212 via SIO port, but I haven't
>been able to find any. The ones at atari@atari.archive.umich.edu haven't
>worked - perhaps I'm using them wrong? Any help is appreciated.
>Thanks.
>Richard Ho v001gyzs@ubvms.cc.buffalo.edu
>/send
>quit
>
As was mentoned in another follow-up, Bobterm supports the SX212. It also
hs a driver that can be used with other programs--especially Kermit. In
fact, that's what I am using now! Kermit comes with a "No Driver" version.
Append this on to a copy of the Bobterm driver (making the driver load first)
and Kermit will work with the SX212.

>electronically or as a printed publication), count me in as a
>subscriber.
First of all count me in a a subscriber, but $25 a year, wooo...
lets get it lower than that!

Now as far as the postscript question...
Why sould we use something that presently has NO relevance to the
8bit world? Why not have a good ML programer create a medium of exchange
for only the Atari 8-bitters out here? Or create a POStcript like emulator
for the atari printer line? I know it's possible because Don't they have
a KERMIT protocal program for our 8-bits? We'll just created our own standards
since Atari just decided to kick our asses out of their pocket books AND hair!
If we are going to Help keep the atari 8-bits alive we need to develop new
technological doodads for our machines, make the program base larger, and

create a reason for the people who are left to STAY with our favorite machines! Support is the ONLY reason IBM and Apple have done what they have done! As an example look at the Texas Instruments machines or the Radio Shack machines! We MUST KEEP LIFE in OUR MACHINES! The must be a way to create a standard for combining text and graphics if postscript has done it, right?
Come on Anything is possible if we put our minds together!

I still love these DAMN machines!

4813. More help for an 8bit mag

Newsgroup: comp.sys.atari.8bit
Date: 1991-12-26 21:56:04 UTC
From: rene@dvorak.amd.com
Message-ID: <1991Dec26.215604.22425@dvorak.amd.com>
Source record: 113217

Well, it seems the time had come for all of us die-hard 8bitters to come to life and give what we can to help the progress of an 8bit magazine. All of you can count me in.

I will setup some postcards and leave them with a vendor in San Antonio. They will be addressed, stamped and ready to be filled out. Once done the vendor or customer can mail it. I will also ask the vendor if I can get his mailing list and send even more cards directly. All that is needed by me is the letter which will be sent and the form the postcard will take.

I'm not sure how big the mailing list is but everytime I go in the store I meet more people and find some that are buying an 8bit for the first time. We all need this magazine to succeed. We all know that it is not the lastest and greast technology but we must not think of it as a dead machine. There are still hundreds of programs and articles which can be written for our favorite machine.

All that is needed is our help. I'm not saying that we will single handedly bring the 8bit back to life and every new program out on the market will come our way. However, we can get the attention of those who haven't given up on us completely and can continue to reap the benefits of their labor.

Thanks......Rene'

4814. OS9 for the Atari 8bits?

Newsgroup: comp.sys.atari.8bit
Date: 1991-12-26 23:35:12 UTC
From: reynolds@fsg.com
Message-ID: <1991Dec26.233512.1735@fsg.com>
Source record: 113218

While replying to one of the comments on my suggestion of the use of PostScript for an electronic magazine I had a thought. What do people think about a port of OS9 to the Atari 8bits? Has such a thing been done? You would lose compatibility with old software (at least until the next reboot), but you would be working on a supported OS with development tools that are currently available and be able to continue to use and expand your current hardware. I know there are people out there using OS9 on the Radi Shack CoCos (I don't remember which model, the one with the 6809). Does anyone here have any experience with OS9?

Several years ago a product called "ComputerEyes" was marketed. It allowed
the user of an Atari 8-bit to digitize a picture from a VCR. Can
anyone tell me where I can get one of these?
I believe it would be possible to backup and restore a hard drive to a
VCR tape using ComputerEyes. The backup would be simple; the Atari would
enter one of the bit-mapped graphics modes, and start loading sectors into
screen RAM, all the while the VCR would be in RECORD mode, recording the
output from the monitor jack through the VCR's auxiliary input jack.
Checksums and redundancy could be included in the refined program; pauses
would be included between screens full of data, to allow the computer
time to digitize the data and write it to disk during a restore.
The ComputerEyes, of course, would be necessary for the restore.
I believe it would be possible to store vast amounts of 8-bit programs on
a VCR tape. If ComputerEyes, or a similar hardware add-on could be had
for a small cost, this could serve as an excellent distribution vehicle for
8-bit software: People could distribute VHS cassettes with thousands of
programs, and a printout showing where each program begins on the tape.
A special program could be used to selectively restore the program(s) to
floppy disk.
This scheme also has the advantage of not requiring ANY hardware to
backup the hard drive. The hardware would only be necessary for a restore.

I'm back for help again (thanks for all who responded to my request for input on joysticks; e-mail will be following shortly).

I'm writing a story on the history of Atari for San Diego's ComputorEdge magazine; deadline is 12-29. I'm strong on the 400/800, but fuzzy on other areas. Was the 2600 video game machine Atari's first home market product? And I know you can get a 2600 adapter for the 5200, but am lost completely about the 7200.

Also, what differentiated the XE/XLs from the 400/800? How much compatibility was there? Are any still manufactured?

Thanks much for all our help.

Happy Holidays,

Jim

Vibratae-Uncles and 8-Bit Pariahs:
Auguries of A Lost Soul At the WAACE Fest

Hartley's "Vibratae-Uncles"

It takes a long time to become an Alchemist. A good millenium, at least.
Following apprenticeships to Avicenna and Averrhoes, I went to England to
spend a century with Merlin and round out my alchemical education under the
tutelage of Thomas Hartley. These were all weird dudes, but Hartley was
the weirdest. Kept telling me to stop thinking and listen to my bones.

Bones, he believed, contained antenna-like organs capable of detecting
odd-wavelength signals the other senses don't perceive. He called them
"vibratae-uncles" (VY-brady). The brain finds it stressful to decipher
these signals, as their interpretation is best accomplished while the other
physical senses are in some manner inhibited. Bone signals manifest as a
vague sense of disquietude throughout the body, an uncomfortable feeling
that something in an otherwise familiar environment is amiss. Things don't
fit, meanings are obscured, connections are missed, reactions are obtuse,
and Weirdness is the order of the day.

Via a metaphysical process involving temporary disconnection of the brain
from the senses and reconnecting it directly to the vibratae-uncles,
Hartley preached it was possible to "tune in" directly to your environment
and discern what's really going on. He said I had the best set of
vibratae-uncles he ever saw but gave me a mediocre grade in interpretation
because I was lazy and kept ignoring the signals. I still regard these
stupid uncle-things as something of a curse. They bug the dickens out of
me and don't go away until I finally sit down and sift the signals. It's

only been during the past century or so that I discovered writing as my way of tuning in to my vibratae-uncles. Which accounts for the difficulty I'm experiencing in recounting my attendance at the recent WAACE Fest.

Ignoring the Bones

I came away from last year's WAACE Fest feeling downright ebullient and had every reason to think this year would be even better. Over the past year I've met perhaps a hundred people whom I knew only as signatures on paper, account names on networks, or voices on the phone. The prospect of getting together with those folks, to assign real faces to the names, was very stimulating. Then too, to renew old acquaintances from last year, not to mention hobnobbing with the crew at Current Notes. Plus I had stuff to trade in the swap room along with a laundry list of goodies I wanted to buy.

I planned my trip in advance, taking advantage of lessons learned the previous year. This year's Fest was a week later than last year's, which meant it would be well-nigh impossible for me to meet our Publisher's deadline for 8-bit material in the November issue. In the last week of September I hunkered down to bang out "Squeezing the Beauty Queen" plus assemble the other 8-bit articles for November; the whole mess was delivered to Joe on GEnie by Oct. 7. I should have felt relaxed with that obligation satisfied, but instead I felt queasy.

At work, the week prior to the Fest was stressful, culminating in a marathon meeting (where I made several presentations to various corporate bigwigs) the day before I left for WAACE. All that week, the queasiness grew. But I was busy each evening packing up stuff to take to the Fest and planning my agenda. I had no time for vague forebodings and wrote it off to a combination of stress and guilt for not answering my magazine-related mail.

WAACE At Last

Last year the weather in Reston, Virginia was fabulous: a classic Indian Summer weekend. Not so this year; I started out from Pennsylvania in a cold, raw rain after fortifying myself with sinus pills. Driving was treacherous, with a slippery coating of wet autumn leaves on some roads. To numb my annoyance at the dirty weather I listened to the Senate's "Judge Thomas Sexual Harassment Hearings" all the way to Virginia. Five hours later I arrived at the hotel suitably numbed but still annoyed. The weather in Virginia was no better than it was in Pennsylvania. Then there was a snafu at check-in that left me ready to chew iron nails.

I started feeling a little better when I saw WAACE holding pre-registration for early arrivals and was able to get my registration squared away the night before the Fest officially opened. I don't think they did that last year. Whoever at WAACE was responsible for that deserves a hearty round of applause. Things improved even more when I encountered John Barnes who invited me to a WAACE-sponsored mixer later that evening. The door prize of the evening was when I ran into Ken Wickert and his wife, and Vern

Smith, of the Syracuse ACE, both of whom had recently contributed articles to Current Notes. The four of us enjoyed a pleasant dinner, after which I attended the WAACE mixer. The main topic of conversation there centered around the Judge Thomas/Anita Hill thing (ugh!). Joe Waters wandered in, looking like he'd had a long day. I apologized for not covering the Fest in the November issue but was relieved when he expressed gratitude for my getting my material in early. Fatigue finally set in, but not before I'd done serious damage to the WAACE booze budget.

I fell asleep that night in a haze of adrenalin-pumping anticipation and alcohol-induced anesthesia. I didn't sleep well. Several times I awoke with a vague sense something was awry. I figured it was just the excitement.

First Day

Following a quick breakfast I checked in at the Current Notes booth in the vendor room to say hello to Joe and Joyce and pick up my CN ID badge. The Fest hadn't officially opened then, and many vendors were still setting up. Consequently I missed seeing who-all was there. It was the first of many missed connections that weekend.

I headed upstairs to get my stuff to take to the swap room. On the elevator I saw Paul Plant who informed me the swap room was already full. I was dumfounded. How could that be? The Fest wasn't officially open yet! Some kind of foulup, I never got the details.

Undaunted, I retrieved my stuff and battled my way into the swap room. It was incredible. The Fest was barely 10 minutes old, and this room was a madhouse. Arms were flailing, hands clutching money and various trade goods waving about in such profusion you couldn't tell which arms belonged to which bodies. People dragging cartons out the door collided with those bringing stuff in. The background roar was tremendous; you had to shout to make yourself heard. The more people shouted, the louder the roar became. I left my stuff along a side wall and sought space on a table. I wasn't gone five seconds before the herd was clawing my cartons.

I decided to hawk my wares from the floor. I later discovered I wasn't supposed to do that. But this was survival. I drew considerable attention by setting up a demo of Super Video powered by a Squeezed Queen. People wanted to know how to fix their XL to make the display so clear. I not only sold the video monitors used in the demo, but in the process referred a number of people to the Current Notes booth with an admonition to buy Joe's back issues and take out a subscription. Many people came by just to shake my hand, see who this Alchemist guy really was, and thank me for keeping 8-bits alive in CN.

I never saw lunch. Late in the day my voice gave out; some kind soul fetched me a cup of water. Jon Mordosky of LVAUG came by and made off with a hundred pounds of AC line regulators. Another fellow wanted my autograph, but I declined, as that isn't my style. Jim Godfrey gave me some chip data and demo disks we had discussed some weeks earlier; I gave

him a sample of rare magnet-core memory as a souvenir. It went on all day like that without letup. I wore off layers of skin shaking hands with people. And making change.

When it was over I staggered into the lobby in a daze, encountering John Barnes who always seemed to be everywhere. I commented how astonished I was at the level of activity in the swap room being double or triple what it was last year. (Several times the fire marshals restricted access to the room.) His response seemed obtuse: "What that tells me is that the market has imploded upon itself". I wasn't sure which market he was referring to but was too tired to care.

The Banquet

I flopped out for awhile, then donned coat and tie for the WAACE banquet. I was glad to decompress in the company of my Syracuse ACE friends, Ken and Vern. These banquets tend to be somewhat dull affairs, and Dull was just what I wanted. It was not to be.

I won't regurgitate the sordid details of the scene of adolescent behavior occurring at one of the other tables that evening, which at times was sufficiently boisterous to disrupt private conversations at my own table. I can only hope the subsequent embarrassment suffered by the parties who attended the banquet with the goal of celebrating puerile rites of passage has chastened their outlook on standards of public conduct. Needless to say, my sense of discomfiture returned with a vengeance. The vibratae-uncles fairly screamed, "Man, you don't belong here!". It was all I could do to stifle the urge to bolt and run.

Joe Waters stood up and announced Dave Troy as the recipient of CN's Author of the Year Award, which took Dave "toadally " by surprise. He gathered himself together for a moment at the podium, fingering the award and muttering how surprised he was. Then Dave did a weird thing: he shot a glance at me and said, "I thought the award would go to Ben Poehland". I wasn't ready for that. The vibratae-uncles were screaming again. It was Number Six of The Ten Most Weird Moments Of My Life.

Later that evening there was another mixer. The party spilled out into the hallway, as the room had grown stuffy. There I encountered Joe Waters and began expressing some concerns about my column, the conflicting roles of editor and columnist. During the conversation I was distressed to discover how divergent from mine were Joe's views of what an editor should be. Joe had just dropped a bombshell: "Well, Current Notes probably doesn't need an 8-bit editor anyway" when our conversation was rudely interrupted by two rowdy drunks who demanded his attention in a discussion of Washington politics (Judge Thomas again). I hung around awhile hoping this would run out of steam so I could explore Joe's comment further. But I was no match for two guys running flat-out on high-octane ethanol. Eventually I drifted back to my room, wondering whether I really knew any of these people and what was I doing here. As I fell asleep, the vibratae-uncles were beating me to death.

Day Two

First thing Sunday morning I decided to check out the vendor area for awhile before heading back to the swap room. I'd spent so much time talking to people and trading stuff the day before I hadn't had time to make purchases. I stopped by the Toad booth and cut a deal with Jennifer for a few software trinkets. Dave Troy was running a demo of Palette Imaging's new ChromaCAD program and commented he thought it was pure genius. Then I talked to Chuck Leazott at the ICD booth. He had a few P:R:C's and other odds'n'ends, but pickings were poor.

And that was it. No Best Electronics. No Alpha Systems. No Advanced Technology Systems. No 8-bit offerings from L&Y. Nothing. Zip. I got queasy again. I wandered aimlessly through the vendor area, past ST booths bearing unfamiliar names. I was a lost soul, a stranger in a strange land. The bone signals rose to a crescendo, flooding my brain with a thought: this was why the swap room was overwhelmed the previous day. It couldn't have taken an 8-bit enthusiast more than a minute to realize the vendor area offered nothing of substance, so they all headed for the swap room. This was a segregated Fest, and I was in the wrong place. I sauntered back to the swap room in despair, to seek comfort among the other lost souls.

On the way, I ran into Bill and Pattie Rayle of Atari Interface Magazine who swept me along to the Atari Explorer booth to introduce me to John Jainschigg. John said Explorer would go to seven issues next year and promised to address the situation from last February when the list of 8-bit items still available from Atari was "inadvertently" omitted. A hollow promise, considering Atari is dumping the 8-bits. I saw no 8-bit articles in the issues of Explorer on display at the booth and wondered who this fellow was trying to kid. But Bill Rayle struck a warmer, more resonant chord when he declared AIM intended to support 8-bits as long as there was any response at all. Pattie chimed in to say they were shipping 8-bit monthly disks at a ratio of 50:100 compared to ST disks, which I thought a very credible figure.

In the swap room I sold a few more items, purchased a couple more trinkets, and briefly demo'ed Super Video and the Squeezed Queen again. I was greatly cheered to see Marv Seaman of Palette Imaging who dropped by to chat. He showed me shaded model printouts from ChromaCAD that looked great. But the vibratae-uncles detected a bewildered, almost bitter tone to his countenance. People thought him a dunce for writing such a fabulous program for a worthless computer. (So, I wasn't the only one having a strange weekend!) As he departed, I wondered cynically if he would change the name of his company to "Pariah Software". The swap room was dead by 4:00PM, so I packed up the remnants of my stuff and set out to see what remained of the Fest in its last hour. I never made it.

The Brodie Encounter

In the lobby I crossed paths with Bob Brodie who was leaving the Fest. We paused for a moment and eyed each other like two caged cats. Then he said, "You know, we haven't had much chance to talk...". "Oh, what the heck", I

muttered; "I wasn't gonna see much of this Fest anyway", and followed him to his room.

We began a chat which lasted the better part of an hour and ended down in the vendor area where men were disassembling the booths. Following a discussion that cleared up a number of sensitive personal issues, Bob brought me up to date on various circumstances surrounding the upcoming Chicago Fest. He confirmed Atari had auctioned off some 8-bit stuff over the summer but claimed it was mostly low-grade junk- 2600 game carts, acoustic modems, etc. Atari still had the "good stuff"- mostly software- well in hand.

I pressed him for information on the volume of this material. He indicated the space of a very large room, with an estimated weight on the order of perhaps several tons: a lot of stuff! How much would it cost Atari to ship that stuff- or a portion of it- to Chicago? A lot of money, according to Bob, more than Atari could afford to spend unless there were realistic prospects of selling it off.

And those prospects were poor. Despite drastic reductions in booth prices, as of the week of WAACE only four 8-bit developers/vendors had signed up for the Chicago Fest. [Note: as of the week of Nov. 7, this number had increased to nine.] I was appalled. Over the summer I had compiled the names of 56 8-bit vendors/developers at Bob's request for LCACE to use as an invitation list; I figured maybe 12 would sign up. Bob's frustration was evident as he sat there spinning out alternative ideas for Chicago; for awhile I wasn't sure if he was talking to me or babbling to himself. Maybe have the 8-bit developers hold "conferences" (like a series of scheduled demos), or sell off the inventory to local distributors like ATV or B&C and then turn the entire 8-bit area at Chicago into a giant swap room.

The thought of the Chicago show turning into another scene like I'd witnessed at WAACE was utterly demoralizing. I shared with Bob some frustrations I've experienced over the past year trying to get the developer/vendor community to advertise and more 8-bit users to subscribe to Current Notes. After exchanging notes in this vein at some length, it was apparent to both of us that our frustrations were mutual. Good lord, I thought, Now I'm agreeing with The Man From Atari. What planet IS this? The vibratae-uncles were having a field day.

The 8-bit vendor community has fallen below the critical mass required to hold it together as a cohesive entity. There are still vendors and developers, and some new products are being introduced. But their numbers are few and dwindling, fragments still glowing on the periphery of an explosion long grown cold. They haven't attempted to compensate or rejuvenate the market by means of more aggressive advertising or attendance at shows. Most bewildering is the laid-back attitude Bob and I have both encountered, wherein some vendors don't seem to care whether they sell product or not. In the end, we could only stare at each other and shrug. There was nothing left to say.

I made plans to dine that evening with Bill and Pattie Rayle of AIM. By this time I was feeling a desperate need to compare notes of my Fest experiences with others who shared my interests; implications for the future of the 8-bit community were looming ominous. That all went out the window when I showed up at the appointed hour and found we had been joined by a fourth party, Mike Vederman of Double Click Software, who fairly dominated the dinner conversation. Mike offered some interesting perspectives on software piracy and the recent anti-piracy ads by IAAD. But I had my own agenda for that evening, and it didn't include software pirates or rave reviews of products for the ST. The growing sense of alarm I was beginning to feel for the future of the 8-bit went unexpressed that night. I returned from dinner greatly frustrated, feeling once again I had ended up someplace I didn't belong. The oblivion of sleep brought welcome relief from the incessant resonance of my bones.

Homeward-Bound Pariah

I checked out Monday morning after a brief exchange with John Barnes on the grim status of 8-bit representation at the Fest. On the way home the vibratae-uncles were finally at rest, leaving me in a somber, reflective mood.

I wondered why there wasn't more 8-bit support from within the ranks of WAACE itself. During 1990 there were a number of issues of CN bearing full-page ads for the NOVATARI 8-bit PD library, which was undergoing a thorough reorganization. But in 1991 that reorganization effort has run aground, and only one small ad for the PD library has appeared. That ad was placed at my request, and getting it approved by NOVATARI was about as much fun as a visit to the dentist. In the weeks before the Fest, several WAACE organizers asked me if I would do a demo or seminar or whatever to attract some 8-bit interest. Being at that time heavily engaged in production on the November issue of CN, I declined (though I ended up running impromptu demos in the swap room anyway). But the very fact that WAACE Fest organizers were turning to me- rather than to their own 8-bit contingent- for 8-bit support at the Fest was disturbing. Especially considering as how I'm an outsider as far as WAACE is concerned: I hold corresponding membership in the Syracuse ACE and am a member of OHAUG, but I'm not a WAACE member.

The issue of segregation hovered over everything. Last year 30% of the traffic in the vendor area was 8-bit. This year, maybe 2%. To be sure, the segregation that occurred at WAACE was a spontaneous event caused by the gross imbalance of ST vs 8-bit representation in the vendor area. But the Chicago Fest is planned to be segregated from the beginning. The origins of this are again economic, as half-price stripped-down booths were offered to the 8-bit developers as incentives to make an appearance.

This annoyed the ST vendors, so the 8-bit shindig is being moved to a separate area where the 8-bitters can congregate. In so doing, however, the community gets divided not just economically but socially as well: ST Brahmins rule the vendor area while 8-bit Pariahs are banished to a swap room, or conference, or whatever Bob Brodie chooses to call it. If the 8-bit vendors/developers allow themselves to be treated like second-class

citizens who won't pay their own way, so also must the market they serve be regarded with disdain. Of course, when they don't show up at all, it's just plain pathetic.

Trapped between the twin forces of dwindling vendor support and uncertainty over the future of 8-bit support in WAACE and Current Notes, this Alchemist-cum-Pariah is taking a long hard look at the future.

Postscript

On November 3, 1991, my home was damaged by fire (faulty masonry in the chimney ignited studs inside a wall). Not only did I escape the blaze unharmed, I fought it with a garden hose before the fire department arrived and managed to save most of the structure. I was extremely lucky. Damage to my personal possessions was minor, and none of my computer equipment was damaged. Even so, preliminary estimates of the repair bill are in the range of $30,000. My insurance company is treating me well, and I'm confident the homeostasis of my existence will eventually be restored.

On November 4, I contacted Joyce Waters to let CN know I would be unable to fulfill my commitments as 8-bit Editor of the magazine after the December issue. I wish to make it clear that my resignation is due solely to the change in my personal circumstances wrought by the fire, and not by any events prior to Nov. 3. I have no idea when The Alchemist will again grace these pages, if at all.

All the projects/manuscripts I had in the works are indefinitely suspended, my plans to attend the Chicago Fest are cancelled. I'm presently laboring under great difficulty to get out the 8-bit material for this issue. Demolition/reconstruction is scheduled to commence about the middle of November, after which time I'll only answer the most critical postal mail. I'll try to maintain a presence on INTERNET and GEnie as long as possible.

I wish to thank the many people who sent cards, letters, and E-mail expressing their concern and support. I can't answer these personally, but I take great comfort knowing there are so many people out there rooting for me. I'm also grateful for the many kind offers of assistance, though fortunately I really don't need any. Except for someone to take over as 8-bit Editor... .

Insofar as this will likely be my last article for a very long time, I'll leave you with the thoughts that are uppermost in my mind. Beginning 1992 the Atari 8-bit community will be a community of orphans, shunned by the very company that spawned the machines we still cherish. If we are to survive as a viable entity, we need to grow up and stand independent of Atari Corporation and the ST/TT community. We need our own forum- something to replace ANTIC- that will serve as a primary channel for the 8-bit community to focus its user/developer/vendor resources free of the intimidating influence of the ST market. Our vendor community needs to abandon its laid-back attitudes and pursue the market more aggressively, with print media advertising, distribution of product catalogs, and appearances at shows. Our programming community needs to shuck off its

tired old venue of videogames and cutesey utilities and produce a wide range of novel user-oriented applications software such as the Commodore/Apple communities enjoy. It is the serious users who will keep our machine alive, and programs written for the narcissistic pleasure of other programmers just won't cut it any more. Heed now these last words of The Alchemist, that we may save ourselves from oblivion.

Good-bye everyone, and God Bless.

Epson is advertising a new bottom-of-the-line laser (below the EPL 7000) called the "Action" laser. Presumably Centronics-compatible, etc. Sells on the street for ca. $600, tho I belive list price is $895 or so.

Anyway, I was wndering, has anyone out there ever tried hooking up ANY kind of laser directly to an 8-bit? I mean like, if you were already using an Epson 24-pin printer successfully with your 8bit (say, an LQ-500), if you just substituted this laser for the dot-matrix would it work OK?

I got this urge to do laser-printing with my XL, if it will indeed work & I won't blow up something.

I think next year the price will go even lower. <drool, drool>

The Atari 2600 was not Atari's first home video game system. They had at least 3 machines before the 2600, but all of them were variations on PONG. Also, they did not have cartridges, but had their game programs built in. The 2600, which came out in 1977 or so, was the first video game system with interchangable game programs. As I'm sure you remember, it was a VERY popular game machine, and still remains in production today. The Atari 5200 came about in late 1981 or early 1982. It was basically an Atari 400 computer with only cosmetic differences. However, it suffered from poor joysticks. It did have an optional accessory to let you plug in 2600 cartridges, as well as an optional trackball controller unit. The machine did feature a numeric keypad on the controller, as well as a pause button. The Atari 7800 came out around 1984, when the market was collapsing. Designed by General Consumer Electronics for Atari, it was like a "turbo 2600". Not only could it play all 2600 games, but also had extended graphics and sound for 7800-specific games. It used joysticks identical to the 2600, but which had 2 different buttons on it. It was shelved during the transition from Warner to the Tramiel family, and was reintroduced around 1986. It is still manufactured today, with new games still coming out for it. Technologically,it is superior to the Nintendo and the Sega Master System, but suffered from poor timing and the lack of advertising that all Tramiel-introduced Atari products.

As for the difference between the 400/800 and the XL/XE systems, The XL/XE have a built-in BASIC (the 400/800 had a cart), slightly different keyboard, and added features in BASIC. The XL/XE also have a parallel bus interface and a HELP key, which the 400/800 did not have. The 800 was the only computer with TWO cartridge ports.

Hope this helps!

~> While replying to one of the comments on my suggestion of the
~>use of PostScript for an electronic magazine I had a thought. What do
~>people think about a port of OS9 to the Atari 8bits? Has such a thing
~>been done?

I'm a sales manager with Microware Systems, the creators of OS-9. While I applaud your suggestion, I'm afraid I can't be too optimistic about your idea. OS-9 was originally written for the 6809, and is currently supported on the 68000 family. While theoretically it would be possible for someone to buy full source code for OS-9/6809 and port it to the 6502, it would be a _very_ complex task, since the 6809 and the 6502 bear little resemblance to one another. One would then have to recompile the various development tools, and make a 6502-specific compiler/assembler.

I'm not sure the 8-bit is lacking for a decent OS (it's not multitasking, but realistically that isn't a great need). It has extensible device driver support and a reasonable choice of languages. Perhaps all that is needed is a first-class C compiler/debugger combination.

Rene Castro's generous offer to distribute postcards thru a vendor in
San Antonio for the write-in campaign was a fine example of the kind of spirit
we are looking for to get our ball rolling. However, at the moment some rather
heavy decision-making is going on, & until some philosophies get sorted out I
recommend we all hold our enthusiasm in check until we hear something from Jeff
McWilliams. He's on vacation right now but promised to get back to me- or to
the Net- when he gets back, sometime the first week of January. (I myself will
be on vacation the whole first week of January, but I'll check the Net at least
once every 2 days.) I hope Jeff will have good news for us, let's keep our
fingers crossed. The write-in campaign was his idea, we really should wait
for him to tell us the details. It's also important that the effort be under
the direction/coordination of a single individual. If we all get impatient
& go off half-cocked doing our own thing, it will be chaos.
I'm sure there's a lot of folks out there chafing at the bit, itching to
help or do whatever someone may ask of them (myself included!). But it's
important for us to get ourselves headed in the proper direction in terms of
what policies will be regarding relationships to other components of our
community besides just the users. There are some potential conflicts here,
which Jeff is struggling to iron out. Much as I'm itching to get going with
the write-in campaign, I'm content to cool my heels for a week or so & give
Jeff some breathing space.
It's the least we can do for the guy, he has accepted a tough challenge.

Frank Seipel's idea to use CompterEyes (C-E) to back up memory on a VCR was interesting.
I paid (ulp!) $129 for C-E, never played with it much. But, like all my toys, I took it apart.
The hardware is a first-class RIPOFF. The circuit board holds I think 5 chips: a TTL gate or 2, a couple op-amps, a 555 timer, plus a few pots & a transistor or 2. Actual value of electronic hardware: $15. It was my intention to reverse-engineer the thing, figure out how it worked. It wouldn't be too difficult. *Sigh*, one of those many projects I wuz gonna do when I got a round tuit.
Question: What's a round tuit?
Answer: I dunno, do they have square ones?

Anyway, if someone did that, you could make the hardware yourself for next to nothing, if all you wanted was just to use it backing up a HD. Of course, someone would still have to write the software. Software is always the hard part.

Well, here goes nothing...
Ive hooked up my hard drive here to my 800xl and MIO.
Everything is great and Im impressed to have 40 megs over here.
Anyways Im going to run a BBS with this, and Im planning to order
PRO or buy an existing node from a local sysop (in the works).
The big hangup is that I will definitely need an Rtime8 for tis
software package, as when it acesses the disk, it loses the time for the
entire duration its accessing..
Whew!
Anyways, Ive exausted all local options (and ICD) for trying to find this
thing...
So im turning the problem over to the net.
Does anyone have an rtime8 for sale?
Does anyone know what dealer I could contact for this item..
And also IM even willing at this point to buy a few broken ones if that is
what it takes to make a working unit.
Anyone with answers.. Write me AT THIS ADDRESS ONLY!
Craigr@athena.mit.edu
Delphi: ASGARDIAN
Responses to this unixland address dont get to me, as I havent paid for a

4833. Atari items for sale or ?

Newsgroup: comp.sys.atari.8bit
Date: 1991-12-30 17:38:31 UTC
From: ehs@src.dec.com
Message-ID: <1991Dec30.093831.19408@src.dec.com>
Source record: 113241

Several years ago, I turned my 800 into a fairly reasonable 6502
development platform. I subsequently moved on to other things and packed
the Atari away. Somewhat later, I reconverted it to a stock 800 for
compatibility with commercial game cartridges.

Although I have fond memories of the Atari, it's pretty clear that I'm
never going to get back to it. Now I need the space, and I'm wondering if
there's still any use for the items below. I'm primarily interested in
finding someone who will put them to good use. I don't follow the
used Atari market at all, but I'd like to get back any packing and
shipping costs plus a little for my trouble. If something interests you,
make me an offer. I will also trade for 68xx or 68xxx family chips.

The 800 itself and the game cartridges are probably going to a nephew, but
I'd consider including them if that's necessary to make an interesting
package.

Except as noted, everything worked when put into storage and includes the
original documentation, but none of it has been checked recently.

Peripherals

Atari 850, with power supply and modem cable
Centurian "Limited Edition" Disk Drive with power supply
FLAKEY and intermittent -- probably a loose connection somewhere
I think this has the electronics from the final rev of the 810,
repackaged with a Tandon drive in a nice metal case
No documentation.

Upgrades

65C02 (CMOS 6502 replacement)
Newell Fast Chip (improved floating point ROM)
OMNIMON and OMNIVIEW, installed on a spare ROM card
Mosaic 32K RAM card
AXLON RAMPower 128 card (128K bank switched memory/RAM disk)

Documentation

Atari Hardware Manual (CO16555)
De Re Atari
SAMS Atari 800 schematics/pictorial
Mapping the Atari (Chadwick, first edition)
Assembly Language Programming for the Atari Computers (Chasin)

Programming Cartridges

ACTION!
MAC/65
Atari Logo
Atari Pilot
Atari Assembler/Editor
Monkey Wrench

Disk Software

From the collection once sold by Antic,

VT-10-Squared
Chameleon
Extended DDT
Sherlock 1050

from David Young,

SpeedScript 80 (for use with OMNIVIEW)

from Signal Computer Consultants, Ltd.,

Train Dispatcher (simulates CTC train dispatching)

plus an uncataloged grab-bag of terminal emulation, disk utility and ham radio software -- some PD, some purchased and some my own, most written in MAC/65 or ACTION! and documented only by the source code.

If interested in some or all of this, please reply to me directly -- I don't have time to read this group regularly.

>fact!

Well (taking this marvelous opportunity) disassembly of SDX drivers is just
a smidgen easier by using DISASM65 from the NASM cross-development package
I advertised recently here and which I have now uploaded to atari.archive.
There is also a new version for NASTY there, which contains a 'safer' version
of the old driver.

NASM as been said before contains, assembler, linker librarian, detokenizer
and utilities like a mac65 detokenizer and a disassembler (for boot sectors
too).
NASM is portable and works under TOS, MSDOS UNIX and apparently AMIGA.

>Checksums and redundancy could be included in the refined program; pauses
In the "refined" program ?
You'd need some HEAVY redundancy and error correction for this scheme to
work at all. It should be obvious (even to someone non-technically oriented),
that putting something on videotape is an *extremely* lossy operation in a
data sense. You experience it every time you tape some TV-broadcast.

I'd guess something akin to bar codes might possibly be useable. Or maybe
Graphics with GCR software (har har).

take it lightly

Source record: 113244
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit

Here's a bit of Atari trivia...

A few months ago, I met a Micheal Groh, Dealer Sales Coordinator, and we exchanged business cards. I noticed that his card was multicolored, in contrast to Sig Hartman's (purple logos), and other Atari employees I've met (blue logos).

"ATARI" is spelled out in letters of different colors, and remembering that the colors refer to the different lines of products that Atari sells. So, in order, here are the "Colors of Atari" and the products they represent.

A blue ST computers
T green TT computers
A orange Video games (??) Lynx
R red XE computers
I purple IBM compatibles

Well, I'm guessing on the orange part of it. But I noticed that Lynx logos are orange. Could the Jaguar logo also be orange? Notice that the logos on the Portfolio are purple.

4840. Re: ComputerEyes

Newsgroup: comp.sys.atari.8bit
Date: 1991-12-31 15:29:51 UTC
From: Chris_F_Chiesa@cup.portal.com
Message-ID: <52242@cup.portal.com>
Source record: 113243

I was also going to point out the "extremely lossy" nature of the proposed scheme for backing up an Atari 8-bit computer onto VHS tape. Note, however, that I target only the particular proposed METHOD of transferring data from computer to tape and back again. Videotape IS INDEED a very high-density storage medium; you could probably put every Atari 8-bit program ever created onto one or two 8mm video cassettes that would fit easily in the palm of your hand. At the present time, however, there appears to be no way to interface an 8mm video data drive (they exist and are used on high-end workstations and the like) to the Atari 8-bit -- unless Bob Puff and the folks at CSS are heading in that direction with the Black Box? Chris Freemesser, would you care to comment? Failing that, someone mentioned a week or two ago that the "next generation Atari dream system," designed-and-built by "we the users" rather than Atari, might include SCSI -- and THAT would allow interfacing to an 8mm video data drive. (This is feasible; I'm told there are third-party peripherals for the <spit on ground> C=64 to drive SCSI devices. The only thing is, most of the people around ME (who are not Atari fans like us) would point out that it'd be somewhat ridiculous to put a (rather expensive) multi-gigabyte-capacity tape drive on an 8-bit 64Kbyte computer... (It might make more sense, but not a LOT more, for those of you with expanded-memory systems -- how many programs or data files are there for the Atari 8-bit that are large enough to justify using such a huge-capacity storage device?) The other problem with 8mm tape storage, in practice, is that "repositioning" doesn't appear to work well. On the computers at my workplace, this causes failure of 8mm tape operations a fairly large percentage (let's say 5%) of the time... I don't think I'd spend my money on an 8mm drive JUST for my Atari, even if it did become feasible/practical.

On a related note, though, what are we all planning to do when our Atari-compatible disk drives, cassette (well...) drives, JOYSTICKS, etc. etc. finally wear out? I'd LIKE to continue using my Atari for the rest of my life, and I expect (knock wood) that to be another 50 or 60 years...

Chris Chiesa
Chris_F_Chiesa@cup.portal.com

4841. Re: I/O via the Joystick Ports on the 400/800

Newsgroup: comp.sys.atari.8bit

From: matthewr@cpqhou.uucp
Message-ID: <1991Dec31.161357.15560@cpqhou.uucp>
Source record: 113242

Has anyone attempted to interface a PC style mouse to an Atari Joystick port? Would anyone have a serial handler that might be useful?

Also, I was wondering about graphical user interfaces on 8-bits. Are there any available for the Atari? I remember seeing adds for GEOS for Commie 64's. I believe they had plans to produce an Atari 8-bit version as well.

Although the overhead involved in supporting a GUI on a 48k Atari 800 would be a problem, I think it is possible. And I imagine it would be "easy" on a 130XE.

It should be possible to write some cool (not to mention, useful) programs on top of a GUI.

MATT

4842. an 8-bit GUI? (was Re: I/O via the Joystick Ports on the 400/800)

IMO, GUIs are a mistake for the 8-bits. Well, maybe some sort of nice little inteface would be fine, but not the typical mouse-driven, overlapping-windows-ridden, pseudo-multitasking mess available for every other system under (and including) the sun. Every GUI I've used has been awkward, bloated, loaded with bugs, and just not very fun to use. But everyone wants to have one, just because everyone else does, and now they have become standard. There have got to be simpler alternatives to the Xerox-style interface.

One thing to keep in mind amid the talk of reanimating the 8-bit computers via a magazine: it is a grave mistake to try to chase after the PC, Mac, etc.; you will never catch up, nor do you want to. Let those machines wallow in their own complexity.

I don't know about using PC mice, but I do know that an ST mouse can be used by 8-bit programs written specifically to use one. There was an article about it in an old Analog Computing magazine, and I believe it came with a simple demo program.

The old Missile Command cartridge also had a track-ball mode which could be used with an ST mouse. I tried it, and in my opinion, it's much more fun than in joystick mode.

In both cases above, the mouse was plugged into the joystick port, not into an rs232 port.

Michael

First, I agree with you, some what! A GUI like windows is just too bulky for my tastes. I like to keep thing simple. I have MS-Windows 3.0 and I don't really see any use for it! Dos suits me just fine!

Second, No one is expecting to even get close to the newer machines {IBMs}. I think I speak of most of us when I say that Our intension of a 8-bit mag. is to KEEP the 8-bits alive! Atari kick our _asses_ out and almost no one supports us now. We need this shot to keep the 8-bits from becoming history!

Thanks for your time!
